User-Centred Design of Systems Jan Noyes,Chris Baber,2012-12-06 System design has conventionally been the province of engineers and the approaches taken to the design of systems have conventionally led to formal specification of the system The past decade or two has seen the rise of another approach that of human computer interaction HCI Given the number of incidents and accidents which are attributed to human error it is sensible to develop an approach to system design which views humans as an essential element in the system Thus an important aspect of designing systems is the study of the interaction between humans and the technology that they use In terms of bringing computers and computing to a wide audience the 1980s were the boom years The first personal computer PC was launched onto the market in February 1978 and since then PCs have become a common place feature of our homes offices schools retail outlets hospitals banks etc Within Western society today there are very few organisations that have not been infiltrated by computer technology and few individuals who have not had experience of computers However the increase in use of computers has not been matched with a corresponding spread of training of users much of the human computer interaction research has sought to design systems which do not require special training i e which people can simply walk up to and use Not surprisingly this has resulted in a

number of difficulties some of which have yet to be satisfactorily resolved **Writing and Designing Manuals** ,2010-12-12

Zwahlen,2006 The project focuses on two major issues the improvement of current work zone design practices and an analysis of vehicle interarrival time IAT and speed distributions for the development of a digital computer simulation model for queues and travel delays in work zones Important considerations in the development of work zone design guidelines include guidance delineation and the safety of workers and drivers A nationwide survey of current work zone best practices was conducted Based on the review of the existing ODOT guidelines superior practices available in other states relevant research and professional judgment of personnel involved in work zone activities a set of guidelines for work zone design are proposed It is anticipated that these research findings will result in the better design of work zones which will minimize traffic delays and improve safety In the second part of the project trailers each using two Wavetronix microwave radar units in side fire mode were developed to nonintrusively measure traffic The traffic was measured at six work zones sites with different types of lane configurations at different freeways in Ohio Traffic on the road was also independently measured using video and radar and the results compared to records from the trailers to verify that the trailers were measuring the traffic with reasonable accuracy IAT data of successive vehicles in freeflowing traffic ahead of work zones were analyzed and IAT distributions were generated as a function of the traffic volume for each lane and relationships between traffic volumes and cumulative IAT distributions were established allowing a direct conversion from hourly traffic counts to corresponding cumulative IAT distributions This conversion method produces fairly accurate cumulative IAT distributions for selected hourly traffic volumes It was also found that the same cumulative IAT distribution can be used to model the free flowing traffic at other freeway locations in Ohio which means that the IAT distributions are portable and scalable and a microscopic digital computer simulation model based on queueing theory may be developed to investigate traffic delays in work zones
