Table 10.4 Summary of Discounted Cash Flow Valuation of Bonds, Preferred Stock, and Common Stock

Bonds and preferred stock share a promised cash payment to the security holder. In the case of a bond, interest and principal must be paid in accordance with the terms of the bond contract provided. Preferred shares have stated dividend rates, which when multiplied by the face or par value of the preferred stock, yield the promised preferred dividend. Both bonds and preferred stock are valued by discounting these promised cash flows back to the present. However, since these are promised (and not expected) cash flows, we discount the cash flows using promised rate of return as reflected in current market prices of similar securities. Common stock, on the other hand, does not have a contractual promised dividend payment, so we apply the discounted cash flow method to the interest by estimating expected future dividends and then discounting them back to the present, using the expected rate of return that an investor would require if investing in a stock with the risk attributes of the shares being valued.

Type of Security	Cash Flow	Discount Rate	Valuation Model
Bond	Promised interest and principal payments. These payments are set forth in the contract between the bond issuing company and the owner of the bond.	Market's required yield to maturity (YTM) on bonds. Typically the YTM on a similar bond is used to value a bond. The YTM is the internal rate of return to the bondholder only if all promised payments are made on time. Consequently, the yield to maturity calculated for a bond is a promised yield and not the expected yield.	$\text{Bond Value} = \text{Interest} \left[\frac{1 - \frac{1}{(1 + \text{YTM}_{\text{market}})^N}}{\text{YTM}_{\text{market}}} \right] + \text{Principal} \left[\frac{1}{(1 + \text{YTM})^N} \right]$
Preferred stock	Promised dividends. Dividends are defined using a continuously or dividend yield that is multiplied by the par or face value of the preferred stock to get the preferred stock dividend.	Market or promised yield on preferred stock. We typically calculate this yield using market prices and promised dividends for similar shares of preferred stock. This yield is a promised yield that will only be earned if the preferred stock dividends are fully paid every period as promised.	$\text{Value of Preferred Stock } (V_P) = \frac{\text{Annual Preferred Stock Dividend}}{\text{Market's Required Yield on Preferred Stock}}$ $= \frac{D_P}{r_P}$
Common stock	Expected future dividends. No dividend is promised for common stock. Instead dividends must be estimated, so we value common stock using expected rather than promised future cash flows. As the common dividend growth rate, we also dividends are estimated using a constant rate of growth from year to year.	Investor's expected rate of return, which is the investor's required rate of return. Since common stock dividends are risky we must expected future dividends and discount them using a risk-adjusted or expected rate of return for investing in shares of stock of firms with similar risk to the common stock being valued. We can estimate this expected rate of return using the CAPM.	$\text{Value of Common} = \frac{D_1(1 + g)}{r_s - g}$ $\text{Stock } (V_S)$

Securities Valuation:

Firm, Equity Asset, and Fixed Income Securities Valuation Vusani Moyo, 2024-08-12 This textbook begins by introducing the concept of the time value of money and explaining how it is applied in valuation. It then uses practical and easy to understand examples to illustrate the application of the time value of money concept in valuing cash flows, annuities, and perpetuities. This is followed by an in depth discussion of the firm's financing sources and the determination of its cost of capital. The remainder of the textbook discusses the valuation of fixed income securities, equity assets, and the firm, featuring specific examples and case studies from South Africa, Europe, and the Americas. Equity asset and firm valuation approaches discussed include variants of single and multiple stage growth dividend discount models, free cash flows, residual income, and multiple valuation approaches. The practical examples and case studies equip students with the tools they need to apply these valuation approaches. Aimed at upper undergraduate and postgraduate accounting and finance students, this textbook discusses in which context each valuation approach is most appropriate. Electronic supplementary materials are available online by chapter.

Frontier Emerging Equity Markets Securities Price Behavior and Valuation Oliver S. Kratz,2007-08-28 Frontier Emerging Equity Markets Securities Price Behavior and Valuation uses the Russian example to illustrate the intricate mechanics of frontier emerging equity market analysis Frontier

markets are those equity markets that do not benefit from the same degree of securities transparency and information dissemination as future emerging markets. In many cases, frontier equity markets are those which have been created almost literally overnight without the infrastructure and institutional readiness of the nations in which they are located. During the 1990s, frontier emerging markets have formed a new investment asset class which requires a very different set of valuation metrics from mature emerging markets. In developing a multi-stage approach to the understanding and valuing of such markets, this book uses the case of the Russian frontier equity market to illustrate topics such as the relationship between equity market infrastructure and valuation during the genesis period of an emerging financial market, evolving market efficiency, and the crucial role of depository receipt programs in the development of these markets. Further, this book develops the first comprehensive framework for valuing a frontier equity market. The role of equity risk premium as it affects early dynamic equity valuation is also covered in order to illuminate important drivers of securities price performance. The book closes by discussing the philology of the frontier market valuation debate in which every market participant is an important purveyor of information and a contributor to the final valuation dimension of equities. The main asset used to present the empirical concepts is a complete research database drawn from actual frontier market investing which previously had been unavailable to academic researchers. As an active institutional asset management professional at a major Wall Street investment firm, the author marries academic theories such as market efficiency and market segmentation to the real world of high stakes and high risk frontier market investing. This book illustrates the applicability and, in some cases, the uselessness of financial theory when applied to this new and rising asset class. It opens the discussion of equity valuation theory for an environment where many conventional rules of asset price determination need to be rewritten. As the first research level monograph exclusively dedicated to frontier emerging equity market analysis, it offers a unique dual perspective on how academic financial research finds it a complementary and sometimes antagonistic counterpart of real life investment decision making. This book can help both professional investors and students of finance to understand frontier equity market valuation and development.
