Conservation Translocations Martin J. Gaywood, John G. Ewen, Peter M. Hollingsworth, Axel Moehrensclager, 2022-12-22 Conservation translocation the movement of species for conservation benefit includes reintroducing species into the wild reinforcing dwindling populations helping species shift ranges in the face of environmental change and moving species to enhance ecosystem function Conservation translocation can lead to clear conservation benefits and can excite and engage a broad spectrum of people However these projects are often complex and involve careful consideration and planning of biological and socio economic issues This volume draws on the latest research and experience of specialists from around the world to help provide guidance on best practice and to promote thinking over how conservation translocations can continue to be developed The key concepts cover project planning biological and social factors influencing the efficacy of translocations and how to deal with complex decision making This book aims to inspire inform and help practitioners maximise their chances of success and minimise the risks of failure

Adaptation and Fitness in Animal Populations Julius van der Werf, Hans-Ulrich Graser, Richard Frankham, Cedric Gondro, 2008-10-17 Fitness and adaptation are fundamental characteristics of plant and animal species enabling them to survive in their environment and to adapt to the inevitable changes in this environment This is true for both the genetic resources of natural ecosystems as well as those used in agricultural production Extensive genetic variation exists between varieties breeds in a species and amongst individuals within breeds This variation has developed over very long periods of time A major ongoing challenge is how to best utilize this variation to meet short term demands whilst also conserving it for longer term possible use Many animal breeding programs have led to increased performance for production traits but this has often been accompanied by reduced fitness In addition the global use of genetic resources prompts the question whether introduced genotypes are adapted to local production systems Understanding the genetic nature of fitness and adaptation will enable us to better manage genetic resources allowing us to make efficient and sustainable decisions for the improvement or breeding of these resources This book had an ambitious goal in bringing together a sample of the world s leading scientists in animal breeding and evolutionary genetics to exchange knowledge to advance our understanding of these vital issues

Nature's Greatest Success Robert N. Spengler III, 2025-05-06 The 15 000 year story of how grass seduced humanity into being its unwitting labor force and the science behind it Domesticated crops were not human creations and agriculture was not simply invented As Robert N Spengler shows domestication was the result of an evolutionary process in which people played a role only unwittingly and as actors in a numberless cast that spanned the plant and animal kingdoms Nature s Greatest Success is the first book to bring together recent scientific discoveries and fascinating ongoing research to provide a systematic account of not only how agriculture really developed but why Through fifteen chapters this book dives deep into the complex processes that drove domestication and the various roles that plants and animals including humans played in bringing about those changes At the intersection of popular history archaeology and evolutionary biology Nature s Greatest Success offers a revolutionary account of humanity not at the apex of nature but deeply embedded in the natural world and the evolutionary processes that continue to guide it even today

Advances in Seed Biology Jose C. Jimenez-Lopez, 2017-12-06 The seed can be considered the most important plant reproductive element as a dispersal unit for a successful reproduction in all gymnosperms and flowering plants The formation of the seed is part of the process of reproduction in seed plants starting with a mature ovule and following with the fertilization by pollen and some growth within the mother plant to the final outcome of an embryo developed from the zygote the seed coat from the integuments of the ovule and a nurturing endosperm in several species Thanks to this key element as it is the seed the spermatophytes now dominate all types of biological niches on land from forests to grasslands both in hot and cold climates In this metadata information era we have the chance for a deeper understanding of seed physiological and developmental processes in order to provide the fundamental basis for making plant seed biology research relevant and productive coping with future challenges
