A Methodology for Developing Multimodal User Interfaces of Information Systems Adrian Stanculescu,2008 The Graphical User Interface GUI as the most prevailing type of User Interface UI in today s interactive applications restricts the interaction with a computer to the visual

modality and is therefore not suited for some users e.g. with limited literacy or typing skills in some circumstances e.g. while moving around with their hands or eyes busy or when the environment is constrained e.g. the keyboard and the mouse are not available. In order to go beyond the GUI constraints the Multimodal MM UIs appear as a paradigm that provides users with great expressive power, naturalness and flexibility. In this thesis we argue that developing MM UIs combining graphical and vocal modalities is an activity that could benefit from the application of a methodology which is composed of a set of models, a method manipulating these models and the tools implementing the method. Therefore we define a design space based method that is supported by model to model colored transformations in order to obtain MM UIs of information systems. The design space is composed of explicitly defined design options that clarify the development process in a structured way in order to require less design effort. The feasibility of the methodology is demonstrated through three case studies with different levels of complexity and coverage. In addition an empirical study is conducted with end users in order to measure the relative usability level provided by different design decisions.

Building Information Modeling Karen M. Kensek, 2014-04-16. This is a design guide for architects, engineers and contractors concerning the principles and specific applications of building information modeling (BIM). BIM has the potential to revolutionize the building industry and yet not all architects and construction professionals fully understand what the benefits of BIM are or even the fundamental concepts behind it. As part of the PocketArchitecture Series it includes two parts: fundamentals and applications, which provide a comprehensive overview of all the necessary and essential issues. It also includes case studies from a range of project sizes that illustrate the key concepts clearly and use a wide range of visual aids. Building Information Modeling addresses the key role that BIM is playing in shaping the software tools and office processes in the architecture, engineering and construction professions. Primarily aimed at professionals, it is also useful for faculty who wish to incorporate this information into their

courses on digital design BIM and professional practice As a compact summary of key ideas it is ideal for anyone implementing BIM

approach of developing Ontology of Information Science Ahlam F. Sawsaa, 2015-06-25 Ontology has been a subject of many studies carried out in artificial intelligence AI and information system communities Ontology has become an important component of the semantic web covering a variety of knowledge domains Although building domain ontologies still remains a big challenge with regard to its designing and implementation there are still many areas that need to create ontologies Information Science IS is one of these areas that need a unified ontology model to facilitate information access among the heterogeneous data resources and share a common understanding of the domain knowledge Recently the development of domain ontologies has become increasingly important for knowledge level interoperation and information integration They provide functional features for AI and knowledge representation Domain Ontology is a central foundation of growth for the semantic web that provides a general knowledge for correspondence and communication among heterogeneous systems Particularly with a rise of ontology in the artificial intelligence AI domain it can be seen as an almost inevitable development
