Pollution Control In The Textile Industry:

Pollution Control in Textile Industry S.C. Bhatia, 2017-10-26 Textile processing industry is characterised not only by the large volume of water required for various unit operations but also by the variety of chemicals used for various processes. There is a long sequence of wet processing stages requiring input of water, chemical and energy and generating wastes at each stage. Any industrial activity causes pollution in one form or the other and so is the textile industry. The textile industry is a significant contributor to many national economies encompassing both small and large scale operations worldwide. Textile processing generates many waste streams including liquid, gaseous and solid wastes, some of which may be hazardous. Several measures for pollution control in textile industry are discussed in detail including End of pipe technologies for wastewater treatment. This book on pollution control in textile industry summarises various aspects of pollution control and is divided into 19 chapters. This edition discusses enzymatic treatment of wastewater containing dyestuffs, degradation of toxic dyes, biological methods of removal of dyes from textile effluents, water conservation in textile industry, recovery of dyes and chromium from textile industry, zero liquid discharge in textile industry, pollution prevention in jute industry and wastes minimisation in textile industry. A unique feature of the book are the chapters on carbon foot print and energy conservation in textile industry. Finally, the role of nanotechnology for the removal of dyes and effluents is also discussed. **The Textile**

Shanmugasundaram, 2021-09-18

Applications of Biotechnology for Sustainable Textile Production is a practical guide to the fundamentals, methods and future prospects for sustainable biotechnological and nanobiotechnological approaches to textile production. The textile industry is highly motivated to reduce its use of natural resources, reduce waste and cost. Processes such as dyeing, printing and finishing fabrics traditionally require a lot of water and can produce hazardous wastes as a by-product. In order to help improve these processes, this book evaluates different technologies, comparing them as ways of saving water, energy, material, waste and time, in addition to the reduction of wastewater and sludge. Technologies investigated include enzymatic treatments, ultrasonic treatments, advanced cotton fiber pre-treatment to

increase dye receptivity nano biotechnology plasma technology and foam technology in the finishing process Health risk assessments and complications resulting from usage of chemicals and other traditional processing technologies are also examined Addresses all five main stages of textile processing including pre treatment dyeing finishing drying and quality control Provides an overview of the techno economic context of the modern textile industry explaining where sustainability fits with other priorities Includes case studies throughout showing how these methods can be used for sustainable textile production *Proceedings of the Symposium on Water Pollution Control in the Textile Industry* ,1969 *Air and Water*
