effectors that combat infected or malignant cells and at later time points into ii memory cells that provide long lasting immunity This differentiation process allows some T cells to leave the confines of secondary lymphoid organs and to enter peripheral tissues in search of pathogens or tumor cells These different environments pose specific challenges for effector and memory T cells to maintain homeostasis T cells directed into the lungs are likely to encounter higher levels of oxygen but lower amounts of nutrients than those directed into the intestinal epithelium In addition to oxygen tension and nutrient concentrations other key factors such as the commensal flora and stromal components create unique conditions that require tissue specific adaptations of T cells These steady state conditions can dramatically change during infection when inflammatory mediators and T cell growth factors are released requiring the immediate response of T cells The gradual changes imposed by growing tumors can also be challenging for T cells due to competition with rapidly cycling tumor cells that deplete essential resources of oxygen and glucose The strategies that T cells employ to respond to the diverse cues from their surroundings are the focus of current research It appears that next to circulating memory T cells that are confined to the circulation and those that survey all of the peripheral tissues dedicated populations of resident memory T cells exist that can optimally adapt to the local circumstances within each tissue Restrictions on the metabolic requirements of T cells residing in tumor tissue have been found to directly impact on effector functions such as cytokine production The fundamental principles of how the machinery of T cells can translate local cues into tissue specific differentiation processes are fascinating and warrant further investigation

**Power Systems Memory Deduplication** Scott Vetter,Rodrigo Ceron Ferreira de Castro,Rafael Folco,Breno Leitao,Humberto Tsubamoto,IBM Redbooks,2012-03-20 This IBM Redpaper™ publication introduces IBM PowerVM Active Memory™ Deduplication on IBM Power Systems™ based on IBM POWER7 processor technology Active Memory Deduplication is a virtualization technology through which memory pages with identical contents can be deduplicated in physical memory This deduplication frees up physical memory positions so that more data can be held in memory at once Memory deduplication is intended to work in a shared memory environment Deduplication works with Active Memory Sharing a technology through which multiple

partitions on a system can share a pool of physical memory Sharing this pool sometimes creates an overcommitment of this physical memory Active Memory Deduplication increases the performance of Active Memory Sharing because the savings can be used to lower memory overcommitment levels Reduction of memory in use can also create room to increase the memory footprint of the logical partitions LPARs This paper describes the advantages of Active Memory Deduplication and requirements for its use and implementation in your Power Systems This paper also helps you set up Active Memory Deduplication on your Power System for use with IBM AIX IBM i and Linux It includes guidance for tuning parameters of Active Memory Deduplication and for troubleshooting issues This paper targets architects and consultants who need to understand how Active Memory Deduplication technology works to design performing solutions The paper also targets technical specialists in charge of setting up and managing Active Memory Deduplication
