Methods Of Orbit Determination:

Methods of Orbit Determination Pedro Ramon Escobal, 1965 *Methods of orbit determination* Pedro R. Escobal, 1985 Satellite Orbits Oliver Montenbruck, Eberhard Gill, 2000-06-15 This modern presentation guides readers through the theory and practice of satellite orbit prediction and determination Starting from the basic principles of orbital mechanics it covers elaborate force models as well as precise methods of satellite tracking The accompanying CD ROM includes source code in C and relevant data files for applications The result is a powerful and unique spaceflight dynamics library which allows users to easily create software extensions An extensive collection of frequently updated Internet resources is provided through WWW hyperlinks

A Development and Comparison of Two Methods of Orbit Determination Harry Louis Hughes, 1967 **Non-linear Orbit Determination Methods** Ali Hasan Nayfeh, 1968 *Manual Onboard Methods of Orbit Determination* Peter Bielkowicz, Roger C. Horrigan, Richard C. Walsh, American Institute of Aeronautics and Astronautics, 1970 *Orbit's Determination Methods for Low-Earth-orbit Satellites* Olivier LHermitte, 1997 Methods for Initial Relative Orbit Determination Using Angles-only Observations Ethan M. Pratt, Old Dominion University. Department of Mechanical and Aerospace Engineering, 2014 On Gauss's Method of Orbit Determination Laurence G. Taff, MASSACHUSETTS INST OF TECH LEXINGTON LINCOLN LAB., 1979 This report presents a statistical version of the Gaussian initial orbit technique It neglects neither the angular velocity nor the radial velocity terms in the f and g series More importantly it provides a rigorous analytically simple result for the radius of convergence of the f and g series The radius of convergence can be extremely small at periastron approaching zero as the eccentricity of the orbit approaches unity The leading term is given by $\sqrt{2} \frac{1}{e} \left(\frac{P}{2\pi} \right)^{3/2}$ as e approaches 1 where P is the orbital period This implies that initial orbit determination by any procedure which uses the f and g series is a process fraught with the possibility of unknown errors

A Numerical Evaluation of Preliminary Orbit Determination Methods William F. Huseonica, 1970 This Technical Note presents a general FORTRAN Code and computer program flowcharts for twelve different Preliminary Orbit Determination Methods PODM A number of solutions were obtained from each PODM using input data from a predetermined reference orbit A comparison of these PODMs in their ability to converge error propagation computation time and total computer core requirements is presented

Methods of Orbit Determination for the Microcomputer Dan L. Boulet, 1991 Application of Initial Orbit Determination Methods to Telescope Observations Carson Hunsberger, 2022 Space Domain Awareness is aimed at providing timely and accurate information of the space environment This was originally done by maintaining a catalog of space objects states position and velocity With the ever increasing population of man made space debris in orbit explosions collisions and potential impacts of near Earth objects it has become imperative to modify the traditional approach to a more predictive tactical and exact rendition Hence a precise orbit propagation model coupled with state of the art orbit determination techniques need to be developed which warrants a better

understanding of the perturbations in the near Earth space Additionally the sensors used to track these objects in space have to be tasked appropriately to observe and catalog these Resident Space Objects RSO This work outlines the intricacies of using inertial measurements from an observation site on the surface of the Earth Optical measurements from the Falcon Telescope Network nodes at Penn State and Colorado managed by USAFA is utilized to schedule observations of objects in the geosynchronous belt An orbit determination algorithm is implemented to obtain the osculating orbital elements of the observed RSO Further a rudimentary sensor tasking strategy is developed by modeling the dynamics equations in a topocentric frame thereby allowing for fast generation of a tasking surface Its utility is demonstrated through simulations showing detections of over 200 RSOs from the geosynchronous satellite catalog

Orbital Mechanics Howard D. Curtis, 2015-07-28 Orbital mechanics is a cornerstone subject for aerospace engineering students However with its basis in classical physics and mechanics it can be a difficult and weighty subject Howard Curtis Professor of Aerospace Engineering at Embry Riddle University the US's 1 rated undergraduate aerospace school focuses on what students at undergraduate and taught masters level really need to know in this hugely valuable text Fully supported by the analytical features and computer based tools required by today's students it brings a fresh modern accessible approach to teaching and learning orbital mechanics A truly essential new resource A complete stand alone text for this core aerospace engineering subject Richly detailed up to date curriculum coverage clearly and logically developed to meet the needs of students Highly illustrated and fully supported with downloadable MATLAB algorithms for project and practical work with fully worked examples throughout Q A material and extensive homework exercises

Preliminary orbit determination for orbital rendezvous using Gauss' method Bryan E. Bingham, 2007

A Comprehensive Comparison Between Angles-only Initial Orbit Determination Techniques Andrew Vernon Schaeperkoetter, 2012 During the last two centuries many methods have been proposed to solve the angles only initial orbit determination problem As this problem continues to be relevant as an initial estimate is needed before high accuracy orbit determination is accomplished it is important to perform direct comparisons among the popular methods with the aim of determining which methods are the most suitable accuracy robustness for the most important orbit determination scenarios The methods tested in this analysis were the Laplace method the Gauss method using the Gibbs and Herrick Gibbs methods to supplement the Double R method and the Gooding method These were tested on a variety of scenarios and popular orbits A number of methods for quantifying the error have been proposed previously Unfortunately many of these methods can overwhelm the analyst with data A new method is used here that has been shown in previous research by the author The orbit error is here quantified by two new general orbit error parameters identifying the capability to capture the orbit shape and the orbit orientation The study concludes that for nearly all but a few cases the Gooding method best estimates the orbit except in the case for the polar

orbit for which it depends on the observation interval whether one uses the Gooding method or the Double R method All the methods were found to be robust with respect to noise and the initial guess if required by the method All the methods other than the Laplace method suffered no adverse effects when additional observation sites were used and when the observation intervals were unequal Lastly for the case when the observer is in space it was found that typically the Gooding method performed the best if a good estimate is known for the range otherwise the Laplace method is generally best

Fundamentals of Astrodynamics and Applications D.A. Vallado,2001-06-30 Fundamentals of Astrodynamics and Applications is rapidly becoming the standard astrodynamics reference for those involved in the business of spaceflight What sets this book apart is that nearly all of the theoretical mathematics is followed by discussions of practical applications implemented in tested software routines For example the book includes a compendium of algorithms that allow students and professionals to determine orbits with high precision using a PC Without a doubt when an astrodynamics problem arises in the future it will become standard practice for engineers to keep this volume close at hand and look it up in Vallado While the first edition was an exceptionally useful and popular book throughout the community there are a number of reasons why the second edition will be even more so There are many reworked examples and derivations Newly introduced topics include ground illumination calculations Moon rise and set and a listing of relevant Internet sites There is an improved and expanded discussion of coordinate systems orbit determination and differential correction Perhaps most important is that all of the software routines described in the book are now available for free in FORTRAN PASCAL and C This makes the second edition an even more valuable text and superb reference
