Fauna and flora of lakes are an integrative result of regional past history and present environmental factors In the Lake Kinneret area where Prehistoric Man witnessed the last tectonic readjustments of the Rift Valley geological events do not belong only to the remote past but still strongly affect the lacustrine environment It is therefore necessary to give a detailed picture of the regional background and limnological features of the lake Parts I and II before describing its planktic and benthic communities Parts III and IV and the Vertebrate fauna of the lake and its surroundings Part V The trophic relationships between communities are beyond the scope of a Monograph and have consequently not been studied in detail but only mentioned occasionally It is intentional that Man and his penetration into the Kinneret area have been treated on a purely zoological basis It underlines the fact that Man as any other living organism is part of the ecosystem and ruled by its laws and that his activities have an automatic feed back on his environment However in contrast with other living organisms Man is able to utilize the lakes and their watersheds for his benefit if by appropriate management he minimizes the damaging influence of his activities This is the main purpose of the research carried out presently on Lake Kinneret and its watershed and briefly described in Part VI *Report of the Chief of Engineers U.S. Army* United States.
