Abecassis de Laredo, N.K. Jurisic, 1973 **Computational Nuclear Physics 2** K. Langanke, J.A. Maruhn, S.E. Koonin, 2012-12-06 Computation is essential to our modern understanding of nuclear systems Although simple analytical

models might guide our intuition the complexity of the nuclear many body problem and the ever increasing precision of experimental results require large scale numerical studies for a quantitative understanding Despite their importance many nuclear physics computations remain something of a black art A practicing nuclear physicist might be familiar with one or another type of computation but there is no way to systematically acquire broad experience Although computational methods and results are often presented in the literature it is often difficult to obtain the working codes More often than not particular numerical expertise resides in one or a few individuals who must be contacted informally to generate results this option becomes unavailable when these individuals leave the field And while the teaching of modern nuclear physics can benefit enormously from realistic computer simulations there has been no source for much of the important material The present volume the second of two is an experiment aimed at addressing some of these problems We have asked recognized experts in various aspects of computational nuclear physics to codify their expertise in individual chapters Each chapter takes the form of a brief description of the relevant physics with appropriate references to the literature followed by a discussion of the numerical methods used and their embodiment in a FORTRAN code The chapters also contain sample input and test runs as well as suggestions for further exploration

Low-Dimensional Cooperative Phenomena H. J.

Keller, 2013-12-01 Theoretical and experimental work on solids with low dimensional cooperative phenomena has been rather explosively expanded in the last few years and it seems to be quite fashionable to contribute to this field especially to the problem of one dimensional metals On the whole one could divide the huge amount of recent investigations into two parts although there is much overlap between these regimes namely investigations on magnetic exchange interactions constrained to mainly one or two dimensions and secondly work done on 1d metallic solids or linear chain compounds with 1d delocalized electrons There is of course overlap from one extreme case to the other with these solids and in some rare cases both phenomena are studied on one and the same crystal In fact however most of the scientific groups in this area could be associated roughly with one of these categories and in addition a separation between theoreticians and experimentalists in each of these groups leads to a further splitting of interests although many theories about these solids have been tested by experimentalists Nevertheless more cooperation and understanding between scientists working on low dimensional cooperative phenomena should appreciably stimulate further development With a better interdisciplinary understanding new ideas could possibly help chemists in synthesizing tailor cut solids This would in return give experimentalists new phenomena to examine and finally would stimulate new theoretical work

The Geometry of Biological Time Arthur T.

Winfrey, 2013-06-29 As I review these pages the last of them written in Summer 1978 some retrospective thoughts come to mind which put the whole business into better perspective for me and might aid the prospective reader in choosing how to approach this volume The most conspicuous thought in my mind at present is the diversity of wholly independent explorations that came upon phase singularities in one guise or another during the past decade My efforts to gather the

published literature during the last phases of actually writing a whole book about them were almost equally divided between libraries of Biology Chemistry Engineering Mathematics Medicine and Physics A lot of what I call gathering was done somewhat in anticipation in the form of conjecture query and prediction based on analogy between developments in different fields The consequence throughout 1979 was that our long suffering publisher repeatedly had to replace such material by citation of unexpected flurries of papers giving substantive demonstration I trust that the authors of these many excellent reports and especially of those I only found too late will forgive the brevity of allusion I felt compelled to observe in these substitutions A residue of loose ends is largely collected in the index under QUERIES It is clear to me already that the materials I began to gather several years ago represented only the first flickering of what turns out to be a substantial conflagration

The Spectra and Dynamics of Diatomic Molecules Helene Lefebvre-Brion, Robert W. Field, 2004-04-28 This book is written for graduate students just beginning research for theorists curious about what experimentalists actually can and do measure and for experimentalists bewildered by theory It is a guide for potential users of spectroscopic data and uses language and concepts that bridge the frequency and time domain spectroscopic communities Key topics concepts and techniques include the assignment of simple spectra basic experimental techniques definition of Born Oppenheimer and angular momentum basis sets and the associated spectroscopic energy level patterns Hund's cases construction of effective Hamiltonian matrices to represent both spectra and dynamics terms neglected in the Born Oppenheimer approximation situations intermediate between Hund's cases spectroscopic perturbations nonlinear least squares fitting calculation and interpretation of coupling terms semi classical WKB approximation transition intensities and interference effects direct photofragmentation dissociation and ionization and indirect photofragmentation predissociation and autoionization processes visualization of intramolecular dynamics quantum beats and wavepackets treatment of decaying quasi eigenstates using a complex Heff model and concluding with some examples of polyatomic molecule dynamics Students will discover that there is a fascinating world of cause and effect localized dynamics concealed beyond the reduction of spectra to archival molecular constants and the exact ab initio computation of molecular properties Professional spectroscopists kinetics ab initio theorists will appreciate the practical simplified model and rigorous theoretical approaches discussed in this book A fundamental reference for all spectra of small gas phase molecules It is the most up to date and comprehensive book on the electronic spectroscopy and dynamics of diatomic molecules The authors pioneered the development of many of the experimental methods concepts models and computational schemes described in this book

Cell Patterning Ruth Porter, John Rivers, 2009-09-16 The Novartis Foundation Series is a popular collection of the proceedings from Novartis Foundation Symposia in which groups of leading scientists from a range of topics across biology chemistry and medicine assembled to present papers and discuss results The Novartis Foundation originally known as the Ciba Foundation is well known to scientists and clinicians around the world

(Jülich),2010 General physics, relativity, astronomy and mathematical physics and methods ,1976 **Select Topics of Econophysics** Amit Sinha,2024-11-04 Economics requires understanding and analyzing forces that bring buyers and sellers to a market place who then negotiate exchanges of goods and services based on a mutually agreeable price Economists have their own method of modeling whereby models are first conceived of some notion of economic and financial thinking before being empirically tested and anomalies are then recognized if the observed data is inconsistent with the hypothetical underpinning This is in inherent contradiction with the modeling approaches of physicists who develop their theories principle and laws after observing empirical data The awareness that physics can enlighten the understanding of human behavior and thus economics and the interest of physicists in applying their training and models to understanding the complexities of finance and economics led to the creation of a new field of study appropriately termed as Econophysics Selected Topics on Econophysics is a collection of essays on topics that enhance and enrich our understanding of economic modeling when the same rigor of modelling used by physicists is brought to developing financial and economic theories These articles include discussions on modeling bitcoins stock index modeling using geometric Brownian motion agent based modeling wealth distribution modeling as well as modeling related to fractal regression and chaotic processes This interdisciplinary book will interest researchers graduate students and professionals in the fields of economics finance as well as physics *Physics and Astrophysics* V. L. Ginzburg,2013-10-22 Physics and Astrophysics discusses some major problems concerned with macrophysics Such topics as the controlled thermonuclear fusion high temperature superconductivity and metallic exciton liquid in semiconductors are covered The definition and elements related to microphysics are discussed This section focuses on mass spectrum quarks and gluons and the interaction of particles at high and super high energies The book gives a brief overview of the general theory of relativity The production and origin of gravitational waves are discussed in detail Cosmology is the study of space and time on a large scale This definition was made as an introduction to the chapter that focuses on the cosmological problems quasars and galactic nuclei and formation of galaxies The necessity of new physics in astronomy is also considered The text includes a section on the physics of black holes neutrons stars and pulsars The book will provide useful information to physicists cosmologists engineers students and researchers in the field of physics
