## Selection I:

**The Descent of Man, and Selection in Relation to Sex ... Second Edition, Revised and Augmented, with Illustrations. Tenth Thousand** Charles Darwin, 1874      *Facts, Conventions, and the Levels of Selection* Pierrick Bourrat, 2021-09-23 Debates concerning the units and levels of selection have persisted for over fifty years One major question in this literature is whether units and levels of selection are genuine in the sense that they are objective features of the world or merely reflect the interests and goals of an observer Scientists and philosophers have proposed a range of answers to this question This Element introduces this literature and proposes a novel contribution It defends a realist stance and offers a way of delineating genuine levels of selection by invoking the notion of a functional unit      **Textbook Selection** Raymond Franzen, Frederic Butterfield Knight, 1922      *On the Origin of Species By Means of Natural Selection* Charles Darwin, 2024-02-12 On the Origin of Species by Means of Natural Selection is a seminal work written by Charles Darwin First published in 1859 this book represents a landmark in the field of biology and is considered one of the most important scientific works ever written In On the Origin of Species Charles Darwin presents his theory of evolution by natural selection The central idea is that species evolve over time through the differential survival and reproduction of organisms with advantageous traits Darwin provides a wealth of evidence from various scientific disciplines including paleontology embryology and biogeography to support his theory The publication of this book had profound implications for the understanding of the diversity of life on Earth and challenged prevailing scientific and religious views at the time Darwin s work laid the foundation for modern evolutionary biology and continues to influence scientific thought to this day

*Evolution and the Levels of Selection* Samir Okasha, 2006-11-16 Does natural selection act primarily on individual organisms on groups on genes or on whole species The question of levels of selection on which biologists and philosophers have long disagreed is central to evolutionary theory and to the philosophy of biology Samir Okasha s comprehensive analysis gives a clear account of the philosophical issues at stake in the current debate      *Current Perspectives on Sexual Selection* Thierry Hoquet, 2015-01-28 This root and branch re evaluation of Darwin s concept of sexual selection tackles the subject from historical epistemological and theoretical perspectives Contributions from a wealth of disciplines have been marshaled for this volume with key figures in behavioural ecology philosophy and the history of science adding to its wide ranging relevance Updating the reader on the debate currently live in behavioural ecology itself on the centrality of sexual selection and with coverage of developments in the field of animal aesthetics the book details the current state of play while other chapters trace the history of sexual selection from Darwin to today and inquire into the neurobiological bases for partner choices and the comparisons between the hedonic brain in human and non human animals Welcome space is given to the social aspects of sexual selection particularly where Darwin drew distinctions between eager males and coy females and rationalized this as evolutionary strategy Also explored are the current definition of sexual selection as opposed to natural

selection and its importance in today's biological research and the impending critique of the theory from the nascent field of animal aesthetics As a comprehensive assessment of the current health or otherwise of Darwin's theory 140 years after the publication of his *Descent of Man* the book offers a uniquely rounded view that asks whether sexual selection is in itself a progressive or reactionary notion even as it explores its theoretical relevance in the technical biological study of the twenty first century

**Levels of Selection in Evolution** Laurent Keller, 2019-12-31 Ever since the groundbreaking work of George Williams W D Hamilton and Richard Dawkins evolutionary biologists have recognized that natural selection generally does not operate for the good of the group but rather for the good of lower level units such as the individual the cell even the gene One of the fundamental problems of biology is what keeps competition between these various levels of natural selection from destroying the common interests to be gained from cooperation In this volume twelve prominent scientists explore this question presenting a comprehensive survey of the current theoretical and empirical research in evolutionary biology Recent studies show that at many levels of biological organization mechanisms have evolved to prevent potential conflict in natural selection Editor Laurent Keller's aim in this book is to bring together leading researchers from all biological disciplines to outline these potential conflicts and discuss how they are resolved A multi level approach of this kind allows important insights into the evolution of life as well as bridging the long standing conceptual chasm between molecular and organismal biologists The chapters here follow a rigorous theoretical framework giving the book an overall synergy that is unique to multi authored books The contributors in addition to the editor are H Charles J Godfray Edward Allen Herre Dawn M Kitchen Egbert Giles Leigh Jr Catherine M Lessells Richard E Michod Leonard Nunney Craig Packer Andrew Pomiankowski H Kern Reeve John Maynard Smith and E rs Szathm ry
