Morphological Image Processing: Architecture and VLSI design P.P. Jonker, 1992 This book describes image processing research based on the morphology of the objects in an image and a VLSI design of a Cellular Logic Processing Element for a real time processor pipeline The field of image processing has spawned a number of special parallel computer architectures the Square SIMD Processor Array the Pyramid the Linear Processor Array or scan line array and the Processor Pipeline This book features a classification of low level image processing operations reviews some intermediate level algorithms and gives a short introduction into computer architecture used for image and digital signal processing Morphology based processing images is introduced by treating cellular logic operations such as skeletonization as hit or miss transformations This approach can be extended to images of higher dimensions than two and a method is described to construct hit or miss masks for the skeletonization of these images In the second part of the book a study is performed on the speed bottlenecks that can be found in the main architectural groups followed by the description of a method for the structured design of integrated digital hardware The VLSI design of a CMOS Processing Element for the real time processing of binary images and the board level design of a scalable processor pipeline for a real time low level processing of grey value images is described in detail Finally a computer architecture for low and intermediate processing of two and three dimensional images is proposed
