Reflector And Lens Antennas:

Reflector and Lens Antennas Carlyle J. Sletten, 1988 *Reflector & Lens Antennas*, 1991 Fresnel Zone Antennas Y. Jay Guo, Stephen K. Barton, 2013-04-17 This book is a research monograph on Fresnel zone antennas. It covers various lens and reflector antennas based on the Fresnel zone concept and phase correction techniques. The material presented is mainly drawn from the theoretical and experimental work published and unpublished by the authors. The book is intended to serve engineers, researchers, and students in the fields of antennas, microwave and millimetre wave engineering, radar, optics, and telecommunications. The authors hope that readers will find the wealth of unique antenna configurations and the theoretical framework presented inspirational and the large number of equations useful in the analysis and design of Fresnel zone antennas.

Modern Lens Antennas for Communications Engineering John Thornton, Kao-Cheng Huang, 2013-03-06 The aim of this book is to present the modern design principles and analysis of lens antennas. It gives graduates and RF/Microwave professionals the design insights in order to make full use of lens antennas. Why do we want to write a book in lens antennas? Because this topic has not been thoroughly publicized, its importance is underestimated. As antennas play a key role in communication systems, recent development in wireless communications would indeed benefit from the characteristics of lens antennas: low profile and low cost etc. The major advantages of lens antennas are narrow beamwidth, high gain, low sidelobes, and low noise temperature. Their structures can be more compact and weigh less than horn antennas and parabolic antennas. Lens antennas with their quasi-optical characteristics also have low loss, particularly at near millimeter and submillimeter wavelengths where they have particular advantages. This book systematically conducts advanced and up-to-date treatment of lens antennas.

Antennas and Wave Propagation G. S. N. Raju, 2006 Antennas and Wave Propagation is written for the first course on the same. The book begins with an introduction that discusses the fundamental concepts, notations, representation, and principles that govern the field of antennas. A separate chapter on mathematical preliminaries is discussed, followed by chapters on every aspect of antennas, from Maxwell's equations to antenna array analysis, antenna array synthesis, antenna measurements, and wave propagation.

The WLAN Band-Notching of Ultra WideBand Antennas

Zeeshan Ahmed, 2016-06-17 Technical Report from the year 2013 in the subject Engineering Communication Technology grade A course Electrical Engineering language English abstract In this report three staircase UWB antennae with WLAN band notch characteristic each having different ground planes are presented These include a Co Planar Waveguide fed antenna a Transmission Line fed antenna with partial ground plane having a Defected Ground Structure DGS and a Transmission Line fed antenna with slotted ground plane All the band notched antennae have rejection characteristics at 5 GHz WLAN band 5 15GHz to 5 35GHz and 5 725GHz to 5 825 GHz while the antenna with slotted ground plane rejects the 4 9GHz WLAN band 4 94GHz to 4 99GHz as well In all the three antennae the WLAN band is notched by embedding a U shaped slot in the transmission line The proposed antennae are carefully designed simulated and tested in order to fulfill the UWB antennae s pre defined criteria The Simulated and Measured results are found to be in good agreement which show the validity of the suggested designs Since the commencement of human civilization humankind attempts to communicate with each other It is the process of communication namely the sharing of information emotions and feelings that has made the mankind the sterling creation of God It all started with gestures of hands and sounds produced by the vocal cords and gradually evolved into wired and wireless communication now The orthodox wireless systems were long range narrowband systems but in order to use the available spectrum now UWB Ultra Wideband short range systems are being used which consume low power and built using low priced digital components The Microstrip Antennae are designed to implement UWB systems because they show effective results for broadband antennae Ultra wideband UWB antennae are by far the most essential elements for UWB systems With the launch of the 3 1GHz to 10 6GHz band applications for short range and high bandwidth portable gadgets are major research areas in UWB systems Consequently the acknowledgment of UWB antennas in printed circuit systems within comparatively small substrate areas is of major significance

The RF and Microwave Handbook Mike Golio, 2000-12-20 The recent shift in focus from defense and government work to commercial wireless efforts has caused the job of the typical microwave engineer to change dramatically The modern microwave and RF engineer is expected to know customer expectations market trends manufacturing technologies and factory models to a degree that is

unprecedented in the *Antenna Handbook* Y.T. Lo, S. W. Lee, 2013-06-29 Techniques based on the method of modal expansions the Rayleigh Stevenson expansion in inverse powers of the wavelength and also the method of moments solution of integral equations are essentially restricted to the analysis of electromagnetic radiating structures which are small in terms of the wavelength It therefore becomes necessary to employ approximations based on high frequency techniques for performing an efficient analysis of electromagnetic radiating systems that are large in terms of the wavelength One of the most versatile and useful high frequency techniques is the geometrical theory of diffraction GTD which was developed around 1951 by J B Keller 1 2 3 A class of diffracted rays are introduced systematically in the GTD via a generalization of the concepts of classical geometrical optics GO According to the GTD these diffracted rays exist in addition to the usual incident reflected and transmitted rays of GO The diffracted rays in the GTD originate from certain localized regions on the surface of a radiating structure such as at discontinuities in the geometrical and electrical properties of a surface and at points of grazing incidence on a smooth convex surface as illustrated in Fig 1 In particular the diffracted rays can enter into the GO shadow as well as the lit regions Consequently the diffracted rays entirely account for the fields in the shadow region where the GO rays cannot exist
