Volume 1 of the book containing 23 chapters discusses the status of technologies capable of yielding substantial reduction of carbon dioxide emissions from major combustion sources. Such technologies include renewable energy sources that can replace fossil fuels and technologies to capture CO<sub>2</sub> after fossil fuel combustion or directly from the atmosphere with subsequent permanent long term storage. The introductory chapter emphasizes the gravity of the issues related to greenhouse gas emission, global temperature correlation, the state of the art of key technologies and the necessary emission reductions needed to meet international warming targets. Section 1 deals with global challenges associated with key fossil fuel mitigation technologies including removing CO<sub>2</sub> from the atmosphere and emission measurements. Section 2 presents technological choices for coal, petroleum and natural gas for the purpose of reducing carbon footprints associated with the utilization of such fuels. Section 3 deals with promising contributions of alternatives to fossil fuels such as hydropower, nuclear, solar, photovoltaics and wind.
