Avian Models for Social Cohesion Andras Csillag, Gergely Zachar, Giorgio Vallortigara, 2020-02-10 Animals living in groups are often linked to group or family members stronger than to other conspecifics and form stronger coalitions often based on genetic relatedness within such groups Effective cooperation within a group requires the preference for proximity of group members suppression of aggression toward conspecifics an ability to perceive and respond to social signals and to change often synchronize behavior accordingly Birds have long been used for a number of investigations involving sensory perception learning feeding strategies and vocal communication Recently they have been proposed as ideal model species even for psychiatric disorders affecting social cohesion such as autism spectrum disorder The physiological mechanisms and neural systems underlying different forms of sociability sexual and parental bonding group preference nesting care for offspring migration can often be studied easier in birds since their social behavioral repertoire as a taxon but sometimes also as individuals is more diverse than that of mammals By contrast with laboratory rodents birds rely less on olfactory cues Rather they tend to use visual and acoustic signals for social interactions much like humans Comparative approach and evolutionary relevance of studies using avian species have already yielded valuable results in several fields of neuroscience learning and memory imprinting acoustic communication birdsong neurogenesis seasonal changes in the song network With the advent of robust novel methods in molecular biology genomics and proteomics information technology and electronic engineering and also based upon an ever improving battery of behavioral tests avian research in social cohesion has likely gained a new impetus

Zentall,2013-12-02 Prepared as a tribute to Donald A Riley the essays that appear here are representative of a research area that has loosely been classified as animal cognition a categorization that reflects a functionalist philosophy that was prevalent in Riley s laboratory and that many of his students absorbed According to this philosophy it is acceptable to hypothesize that an animal might engage in complex processing of information as long as one can operationalize evidence for such a process and the hypothesis can be presented in the context of testable predictions that can differentiate it from other mechanisms The contributions to this volume represent the three most important areas of research in animal cognition stimulus representation memory processes and perceptual processes although current research has considerably blurred these distinctions *Indexes to the Epilepsy Accessions of the Epilepsy Information System* J. Information Processing Kimiyo Murata-Soraci,2003-03-30 Visual information processing in humans with intellectual disabilities and in animals is presented for conceptual and methodological reasons Much of the evolutionary path of higher primate species has involved the development of sophisticated visual systems that interact with complex higher order cognitive processes Key questions in cognitive science address the manner in which the environment is represented by the organism and thus relate to how knowledge about the world is gleaned with implications for theories of action and decision making Finally it has become apparent that the distinction between perceptual and cognitive processes is not always a clear one and that these processes interact in critical ways in underlying complex behavioral repertoires Consistent with the emphasis in this series on individual differences both typical and atypical development are explored here Philosophical approaches to visualism are also presented Chapters have import both for basic science and for the development of applications *The Neuron and the Mind* William R. Uttal,2016-07-01 This book a companion to William R Uttal s earlier work on macrotheories theories of mind brain relationships reviews another set of theories those based on microneuronal measurements Microneuronal theories maintain the integrity of individual neurons either in isolation or as participants in the great neuronal networks that make up the physical brain Despite an almost universal acceptance by cognitive neuroscientists that the intangible mind must in some way be encoded by network states Uttal shows that the problem of how the transformation occurs is not yet supported by empirical research findings at the micro as well as at the macro levels of analysis Theories of the neuronal network survive more as metaphors than as robust explanations This book also places special emphasis on the technological developments that stimulate these metaphors A major conclusion drawn in this book is that it is not at all certain that the mind brain problem is solvable in the sense that many other grand scientific problems are
