Cancer Pathogenesis: Molecular and Cellular Mechanisms of Tumor evolution, Therapy-Resistance and Immune Evasion Sambhavi Animesh, Ajinkya Revandkar, Lucio Miele, 2025-01-24

Cancer pathogenesis is a pathophysiological understanding of how molecular and cellular events play a causal role in transforming tumors from benign to malignant state. This often involves genetic, epigenetic, proteomic and metabolic alterations within solid tumors and blood cells. Besides cell intrinsic factors, tumors are also composed of stromal fibroblasts, blood vessel and immune cells that are also implicated in tumor progression. Immune evasion is another critical step of the cancer progression wherein tumor cells modulate host immune system to escape from getting destroyed. Additionally, stemness in cancer cells is another acquired intrinsic ability of self renewal, differentiation heterogeneity and survival. Such properties give an edge to the tumors to maintain malignancy and confers treatment resistance. Most anti cancer therapies that trigger cell death, senescence and or dormancy and may backfire into maladaptive responses that lead to therapy resistance and promote tumor progression. Together these highlight the most challenging issues of cancer pathogenesis. This Research Topic aims to summarize the cutting edge research for the broader understanding of the molecular and cellular determinants involved in cancer initiation and progression and their impact on the anti tumor therapies and immune evasion. In summary, this topic will help researchers to gain a more comprehensive understanding of the cancer pathogenesis which can be used further in the development of novel therapies.

HIV: Molecular Biology and Pathogenesis: Viral Mechanisms, 2000-09-07. The cumulative death toll from AIDS has reached 16.3 million individuals and more than 33 million persons are currently living with HIV-1. Although it is one of the most widely studied viruses, many mysteries remain about this pathogen. In this comprehensive two volume set, HIV-1: Molecular Biology and Pathogenesis, leading investigators in HIV research present a timely picture of the molecular mechanisms which guide HIV-1 expression and replication and provide the most current clinical strategies for combating this virus. Twenty six teams of experts unravel structure function interactions of HIV-1 with host cells and the resulting pathological consequences, review strategies for treatment and describe ongoing progress in developing animal models and prophylactic vaccines. The two volumes covering viral mechanisms and clinical applications respectively are written by an international collection of AIDS experts from North America, Europe, Australia and Asia. Detailed insights into viral packaging, expression and assembly. Mechanistic understanding of how HIV interacts with receptors and infects cells. Delineation of virally encoded regulatory processes unique to HIV. Clinical Applications. An updated review of current chemotherapeutics for HIV. New concepts in the discovery and design of novel anti HIV drugs. The latest developments in HIV vaccine research.
