

# Parallel vs. concurrent

- **parallel:** Using multiple processing resources (CPUs, cores) at once to solve a problem faster.
  - Example: A sorting algorithm that has several threads each sort part of the array.
- **concurrent:** Multiple execution flows (e.g. threads) accessing a shared resource at the same time.
  - Example: Many threads trying to make changes to the same data structure (a global list, map, etc.).
- Many programmers confuse these two concepts.
  - Threads are often used to implement both.

Martin,P.H. Welch,2004 Communicating Process Architecture CPA describes an approach to system development that is process oriented It makes no great distinction between hardware and software It has a major root in the theory of Communicating Sequential Processes CSP However the underlying theory is not limited to CSP The importance of mobility of both channel and process within a network sees integration with ideas from the calculus Other formalisms are also exploited such as BSP and MPI The focus is on sound methods for the engineering of significant concurrent systems including those that are distributed across the Internet or within a single chip and or software scheduled on a single execution unit Traditionally at CPA the emphasis has been on theory and practice developing and applying tools based upon CSP and related theories to build high integrity systems of significant size In particular interest focuses on achieving scalability and security against error The development of Java C and C libraries to facilitate secure concurrent programming using mainstream languages has allowed CPA to continue and proliferate This work continues in support of the engineering of distributed applications Recently there has been greater reference to theory and its more direct application to programming systems and languages In this volume the formal CSP is very well presented The papers provide a healthy mixture of the academic and commercial software and hardware application and infrastructure which reflects the nature of the discipline     *Optimized Computing in C++: Mastering Concurrency, Multithreading, and Parallel Programming* Peter Jones,2025-01-11 Discover the future of high performance computing with Optimized Computing in C Mastering Concurrency Multithreading and Parallel Programming a comprehensive guide designed to elevate your C programming skills to unparalleled heights Whether you're an intermediate programmer eager to broaden your understanding or an experienced developer aiming to optimize your applications this book is an invaluable resource for maximizing efficiency and speed using C Delve into the fundamental principles of high performance computing HPC and grasp the pivotal role of C in building scalable robust applications Master the intricacies of concurrency threading and parallel programming through well organized chapters rich with code snippets practical examples and real world case studies Covering essential topics from basic thread management to advanced GPU programming and MPI for distributed computing this book spans the full spectrum of HPC in C Leverage modern C standards and the latest features to simplify concurrent programming ensuring your applications remain fast and future proof Confront real world
