Respiratory Muscles In Chronic Obstructive Pulmonary Disease:

Respiratory Muscles in Chronic Obstructive Pulmonary Disease A. Grassino, C. Fracchia, C. Rampulla, L. Zocchi, 2013-03-14 While emphysema and chronic bronchitis are primarily lung diseases one of their major consequences is to deeply affect the function of the respiratory muscles Lung hyperinflation shortens the inspiratory muscles due to increased airways resistance more of their effort is demanded and changes in nutritional status weaken them further Their malfunction can lead to severe dyspnea and to failure of the ventilatory pump Over the last 10 years we have witnessed an explosion of information of how respiratory muscles function in health and disease new techniques for their evaluation have been created the concept of fatigue weakness and failure was developed and their rest or training was attempted The implication of respiratory muscles malfunction in respiratory medicine has reached a prominent place It seems remarkable that while some aspect of skeletal muscles function requires molecular biology techniques to find new answers we still know little on respiratory muscles interaction strategies of coordination their role in dyspnea chronic hypercapnia or how to effectively improve their function in patients This workshop was organized and held at the Medical Center of Rehabilitation in Montescano and represents an attempt to focus on how the newly acquired wealth of information can eventually be transformed into medical care The participants in this workshop brought forward challenging thoughts and we are most grateful for their participation This book represents a report of the proceedings and also provides the most updated information in this field

Management of Chronic Obstructive Pulmonary Disease N.M. Siafakas, 2006-12-01 Since the 1970s therapeutic nihilism has moved towards a more optimistic attitude regarding therapeutic alternatives in COPD Research focused on inflammatory and physiological mechanisms has substantially increased during the last 10 years This has led to an increased understanding of the pathophysiology of the disease which has resulted in improved treatment Thus in parallel to smoking cessation programmes other treatment modalities have been shown to be successful Physiotherapy and pharmacotherapy have been extensively studied and the knowledge regarding what these therapeutic approaches

Tumour necrosis factor-alpha and weight loss in chronic obstructive pulmonary diseases Sherif Mohamed, 2018-08-07 Master's Thesis from the year 2001 in the subject Medicine Neoplasms Oncology language English abstract Weight loss is a common feature in patients with chronic obstructive pulmonary disease COPD The clinical importance of weight loss particularly loss of fat free mass FFM has been demonstrated in its adverse effects on physical performance and quality of life Moreover weight loss and a low body weight are unfavorable prognostic factors in survival independent of lung function Mechanisms of malnutrition in those patients are not fully understood Several factors have been implicated Increased resting energy expenditure REE contributes the main hypothesis for weight loss in COPD patients However not all patients with COPD who lose weight are hypermetabolic Recent data have shown that a systemic inflammatory response is present in patients with COPD A clear evidence for a relationship between weight loss and plasma tumour necrosis factor alpha TNF has been shown in COPD patients TNF produces a cachexia like syndrome in animal models and has been implicated as a mediator of cachexia in several clinical conditions including cancer chronic heart failure cystic fibrosis and anorexia nervosa Nutritional assessment for COPD patients is essential to identify those individuals who will benefit from nutritional support therapies and to determine baseline values to measure the effectiveness of nutritional intervention It includes several methods no simple recommendation can be given regarding the best method for nutritional assessment Because of the negative impact of malnutrition on the respiratory system in COPD patients contributing to morbidity and mortality it's valuable to include management strategies that increase energy balance in order to increase weight and fat free mass in those malnourished COPD patients The aim of this study is to determine the most valuable measurements to assess the nutritional status of COPD patients as regards the anthropometric measurements the somatic and visceral proteins and markers of inflammation and to evaluate the correlation between serum TNF levels and weight loss among those patients as a trial to improve their clinical prognosis and quality of life
