Medical subject headings. *An Introduction to Neural Information Processing* Peiji Liang, Si Wu, Fanji Gu, 2015-12-22 This book provides an overview of neural information processing research which is one of the most important branches of neuroscience today. Neural information processing is an interdisciplinary subject and the merging interaction between neuroscience and mathematics, physics as well as information science plays a key role in the development of this field. This book begins with the anatomy of the central nervous system followed by an introduction to various information processing models at different levels. The authors all have extensive experience in mathematics, physics and biomedical engineering and have worked in this multidisciplinary area for a number of years. They present classical examples of how the pioneers in this field used theoretical analysis, mathematical modeling and computer simulation to solve neurobiological problems and share their experiences and lessons learned. The book is intended for researchers and students with a mathematics, physics or informatics background who are interested in brain research and keen to understand the necessary neurobiology and how they can use their specialties to address neurobiological problems. It also provides inspiration for neuroscience students who are interested in learning how to use mathematics, physics or informatics approaches to solve problems in their field. **Adaptive Mechanisms in the Ecology of Vision** S. Archer, M.B. Djamgoz, E. Loew, J.C. Partridge, S. Vallerga, 2013-04-17 John Lythgoe was one of the pioneers of the Ecology of Vision, a subject that he ably delineated in his classic and inspirational book published some 20 years ago. At heart the original book aimed generally to identify interrelationships between vision, animal behaviour and the environment. John Lythgoe excelled at identifying the interesting questions in the ecology of an animal that fitted the answers presented by an analysis of the visual system. Over

the last twenty years however since Lythgoe's landmark publication much progress has been made and the field has broadened considerably. In particular our understanding of the adaptive mechanisms underlying the ecology of vision has reached considerable depths extending to the molecular dimension partly as a result of development and application of new techniques. This complements the advances made in parallel in clinically oriented vision research.² The current book endeavours to review the progress made in the ecology of vision field by bringing together many of the major researchers presently active in the expanded subject area. The contents deal with theoretical and physical considerations of light and photoreception, present examples of visual system structure and function and delve into aspects of visual behaviour and communication. Throughout the book we have tried to emphasise one of the major themes to emerge within the ecology of vision: the high degree of adaptability that visual mechanisms are capable of undergoing in response to diverse and dynamic environments and behaviours.
