**Seismic While Drilling** F.B Poletto, F. Miranda, 2004-06-30 The purpose of this book is to give a theoretical and practical introduction to seismic while drilling by using the drill bit noise This recent technology offers important products for geophysical control of drilling It involves aspects typical of borehole seismics and of the drilling control surveying hitherto the sole domain of mudlogging For aspects related to the drill bit source performance and borehole acoustics the book attempts to provide a connection between experts working in geophysics and in drilling There are different ways of thinking related to basic knowledge operational procedures and precision in the observation of the physical quantities The goal of the book is to help build a bridge between geophysicists involved in seismic while drilling who may need to familiarize themselves with methods and procedures of drilling and drilling rock mechanics and drillers involved in geosteering and drilling of smart wells who may have to familiarize themselves with seismic signals wave resolution and radiation For instance an argument of common interest for drilling and seismic while drilling studies is the monitoring of the drill string and bit vibrations This volume contains a large number of real examples of SWD data analysis and applications

*Advanced Seismic While Drilling System*, 2008 A breakthrough has been discovered for controlling seismic sources to generate selectable low frequencies Conventional seismic sources including sparkers rotary mechanical hydraulic air guns and explosives by their very nature produce high frequencies This is counter to the need for long signal transmission through rock The patent pending SeismicPULSER trademark methodology has been developed for controlling otherwise high frequency seismic sources to generate selectable low frequency peak spectra applicable to many seismic applications Specifically we have demonstrated the application of a low frequency sparker source which can be incorporated into a drill bit for Drill Bit Seismic While Drilling SWD To create the methodology of a controllable low frequency sparker seismic source it was necessary to learn how to maximize sparker

efficiencies to couple to and transmit through rock with the study of sparker designs and mechanisms for a coupling the sparker generated gas bubble expansion and contraction to the rock b the effects of fluid properties and dynamics c linear and non linear acoustics and d imparted force directionality After extensive seismic modeling the design of high efficiency sparkers laboratory high frequency sparker testing and field tests were performed at the University of Texas Devine seismic test site The conclusion of the field test was that extremely high power levels would be required to have the range required for deep 15 000 ft high temperature high pressure HTHP wells Thereafter more modeling and laboratory testing led to the discovery of a method to control a sparker that could generate low frequencies required for deep wells The low frequency sparker was successfully tested at the Department of Energy Rocky Mountain Oilfield Test Center DOE RMOTC field test site in Casper Wyoming An 8 in diameter by 26 ft long SeismicPULSER trademark drill string tool was designed and manufactured by TII An APS Turbine Alternator powered the SeismicPULSER trademark to produce two Hz frequency peak signals repeated every 20 seconds Since the ION Geophysical Inc ION seismic survey surface recording system was designed to detect a minimum downhole signal of three Hz successful performance was confirmed with a 5 3 Hz recording with the pumps running The two Hz signal generated by the sparker was modulated with the 3 3 Hz signal produced by the mud pumps to create an intense 5 3 Hz peak frequency signal The low frequency sparker source is ultimately capable of generating selectable peak frequencies of 1 to 40 Hz with high frequency spectra content to 10 kHz The lower frequencies and perhaps low frequency sweeps are needed to achieve sufficient range and resolution for realtime imaging in deep 15 000 ft high temperature 150 C wells for a geosteering b accurate seismic hole depth c accurate pore pressure determinations ahead of the bit d near wellbore diagnostics with a downhole receiver and wired drill pipe and e reservoir model verification Furthermore the pressure of the sparker bubble will disintegrate rock resulting in an increased overall rates of penetration Other applications for the SeismicPULSER trademark technology are to deploy a low frequency source for greater range on a wireline for Reverse Vertical Seismic Profiling RVSP and Cross Well Tomography Commercialization of the technology is being undertaken by first contacting stakeholders to define the value proposition for rig site services utilizing SeismicPULSER trademark technologies Stakeholders include national oil companies independent oil companies independents service companies and commercial investors Service companies will introduce a new Drill Bit SWD service for deep HTHP wells Collaboration will be encouraged between stakeholders in the form of joint industry projects to develop prototype tools and initial field trials No barriers have been identified for developing utilizing and exploiting the low frequency SeismicPULSER trademark source in a variety of applications Risks will be minimized since Drill Bit SWD will not interfere with the drilling operation and can be performed in a relatively quiet environment when the pumps are turned off The new source must be integrated with other Measurement While Drilling MWD tools To date each of the oil companies and service companies contacted have shown interest in participating in the commercialization of the low frequency

**Instruments, Measurement Principles and Communication Technologies for Downhole Drilling Environments** Chinthaka P. Gooneratne, Bodong Li, Max Deffenbaugh, Timothy Moellendick, 2018-12-30

This book presents a complete review of the unique instruments and the communication technologies utilized in downhole drilling environments. These instruments and communication technologies play a critical role in drilling hydrocarbon wells safely, accurately and efficiently into a target reservoir zone by acquiring information about the surrounding geological formations as well as providing directional measurements of the wellbore. Research into instruments and communication technologies for hydrocarbon drilling has not been explored by researchers to the same extent as other fields such as biomedical, automotive and aerospace applications. Therefore the book serves as an opportunity for researchers to truly understand how instruments and communication technologies can be used in a downhole environment and to provide fertile ground for research and development in this area. A look ahead discussing other technologies such as micro electromechanical systems (MEMS) and fourth industrial revolution technologies such as automation, the industrial internet of things (IIoT), artificial intelligence and robotics that can potentially be used in the oil and gas industry are also presented as well as requirements still need to be met in order to deploy them in the field.
