

Shaken baby syndrome

A baby's head can weigh one-fourth of its total body weight, and because the neck muscles are still weak, any violent shakes will cause the head to fling out of control. The impact on the brain can be up to 30 times the force of gravity and cause permanent or fatal damage to the baby. Because damage is internal, signs of danger may not be seen until it's too late.

- 1** Blood vessels that lead from the brain to the dura membrane are most susceptible to tearing since the subdural space between the brain and the skull is greater for babies. Such hemorrhaging is what doctors detect in CAT scans.
- 2** Nerves inside the brain may sever. If this happens, the brain will swell, cutting off oxygen to the brain. In surviving babies, blindness and brain damage may also occur.
- 3** The brain stem is where vital sensors are located. If this is severed or damaged, the baby will experience respiratory problems and vomiting.
- 4** The optic nerve is often damaged, which causes retinal bleeding.

A traumatic shake

Shaking a baby is much like the effects of holding a bowling ball upright in your hand and shaking it back and forth. Like a baby's neck, the wrist would not support the force, allowing the bowling ball to swing back and forth. For the baby's delicate brain, this would be like an earthquake.
