Machine Learning Of Inductive Bias:

Machine Learning of Inductive Bias Paul E. Utgoff, 2012-12-06 This book is based on the author's Ph D dissertation 56 The thesis research was conducted while the author was a graduate student in the Department of Computer Science at Rutgers University The book was prepared at the University of Massachusetts at Amherst where the author is currently an Assistant Professor in the Department of Computer and Information Science Programs that learn concepts from examples are guided not only by the examples and counterexamples that they observe but also by bias that determines which concept is to be considered as following best from the observations Selection of a concept represents an inductive leap because the concept then indicates the classification of instances that have not yet been observed by the learning program Learning programs that make undesirable inductive leaps do so due to undesirable bias The research problem addressed here is to show how a learning program can learn a desirable inductive bias

Change of Representation and Inductive Bias D. Paul Benjamin, 2012-12-06 Change of Representation and Inductive Bias One of the most important emerging concerns of machine learning researchers is the dependence of their learning programs on the underlying representations especially on the languages used to describe hypotheses The effectiveness of learning algorithms is very sensitive to this choice of language choosing too large a language permits too many possible hypotheses for a program to consider precluding effective learning but choosing too small a language can prohibit a program from being able to find acceptable hypotheses This dependence is not just a pitfall however it is also an opportunity The work of Saul Amarel over the past two decades has demonstrated the effectiveness of representational shift as a problem solving technique An increasing number of machine learning researchers are building programs that learn to alter their language to improve their effectiveness At the Fourth Machine Learning Workshop held in June 1987 at the University of California at Irvine it became clear that the both the machine learning community and the number of topics it addresses had grown so large that the representation issue could not be discussed in sufficient depth A number of attendees were particularly interested in the related topics of constructive induction problem reformulation representation selection and multiple levels of abstraction Rob Holte Larry Rendell and I decided to hold a workshop in 1988 to discuss these topics To keep this workshop small we decided that participation be by invitation only

Inductive Biases in Machine Learning for Robotics and Control Michael Lutter, 2023-07-31 One important robotics problem is How can one program a robot to perform a task Classical robotics solves this problem by manually engineering modules for state estimation planning and control In contrast robot learning solely relies on black box models and data This book shows that these two approaches of classical engineering and black box machine learning are not mutually exclusive To solve tasks with robots one can transfer insights from classical robotics to deep networks and obtain better learning algorithms for robotics and control To highlight that incorporating existing knowledge as inductive biases in machine learning algorithms improves performance this book covers different approaches for learning dynamics models and

learning robust control policies The presented algorithms leverage the knowledge of Newtonian Mechanics Lagrangian Mechanics as well as the Hamilton Jacobi Isaacs differential equation as inductive bias and are evaluated on physical robots

Change of Representation and Inductive Bias D. Paul Benjamin, 1989-12-31 [Inductive Bias in Machine Learning](#)
Luca Rendsburg, 2022 Inductive bias describes the preference for solutions that a machine learning algorithm holds before seeing any data It is a necessary ingredient for the goal of machine learning which is to generalize from a set of examples to unseen data points Yet the inductive bias of learning algorithms is often not specified explicitly in practice which prevents a theoretical understanding and undermines trust in machine learning This issue is most prominently visible in the contemporary case of deep learning which is widely successful in applications but relies on many poorly understood techniques and heuristics This thesis aims to uncover the hidden inductive biases of machine learning algorithms In the first part of the thesis we uncover the implicit inductive bias of NetGAN a complex graph generative model with seemingly no prior preferences We find that the root of its generalization properties does not lie in the GAN architecture but in an inconspicuous low rank approximation We then use this insight to strip NetGAN of all unnecessary parts including the GAN and obtain a highly simplified reformulation Next we present a generic algorithm that reverse engineers hidden inductive bias in approximate Bayesian inference While the inductive bias is completely described by the prior distribution in full Bayesian inference real world applications often resort to approximate techniques that can make uncontrollable errors By reframing the problem in terms of incompatible conditional distributions we arrive at a generic algorithm based on pseudo Gibbs sampling that attributes the change in inductive bias to a change in the prior distribution The last part of the thesis concerns a common inductive bias in causal learning the assumption of independent causal mechanisms Under this assumption we consider estimators for confounding strength which governs the generalization ability from observational distribution to the underlying causal model We show that an existing estimator is generally inconsistent and propose a consistent estimator based on tools from random matrix theory *Natural Inductive Biases for Artificial Intelligence* T. Anderson Keller, 2023 The study of inductive bias is one of the most all encompassing in all of machine learning Inductive biases define not only the efficiency and speed of learning but also what is ultimately possible to learn by a given machine learning system The history of modern machine learning is intertwined with that of psychology cognitive science and neuroscience and therefore many of the most impactful inductive biases have come directly from these fields Examples include convolutional neural networks stemming from the observed organization of natural visual systems and artificial neural networks themselves intending to model idolized abstract neural circuits Given the dramatic successes of machine learning in recent years however more emphasis has been placed on the engineering challenges faced by scaling up machine learning systems with less focus on their inductive biases This thesis will be an attempted step in the reverse direction To do so we will cover both naturally relevant learning algorithms as well as natural structure inherent to neural representations

We will build artificial systems which are modeled after these natural properties and we will demonstrate how they are both beneficial to computation and may serve to help us better understand natural intelligence itself
