Phagocytosis Maurice B. Hallett,2020-05-12 Phagocytosis is the engulfment of particulate matter by cells It is a fundamental and probably primitive cell biological process which is important in single celled organisms such as amoeba multicellular animals including coelenterates and in higher animals In humans and other mammals specialised immune cells phagocytes utilise phagocytosis in their crucial role of engulfing and destroying infecting microbes Yet surprisingly the biophysics and biochemistry underlying the process has only become clear recently with the advent of genetic manipulation and advances in single cell imaging In this volume the aim is to bring together recent fundamental advances that give a clear picture of the underlying mechanism involved in phagocytosis Not only is this an important topic in its own right but a full

understanding of the process will have a potential impact on human medicine since as antibiotics become less effective in fight infection researchers are looking at alternative approaches including enhancing the natural immunity brought about by immune phagocytes The aim is to provide a comprehensive volume on the topic with separate chapters on identified recent advances each written by the major contributors in each area In addition the volume will attempt to give a wider overview than is often the case in single author reviews with an emphasis here on the cell biological understanding of phagocytosis using biophysical approaches alongside the biochemical and imaging approaches

Mathematical Models in Molecular Cellular Biology Lee A. Segel, 1983-10-06 Interest in theoretical biology is rapidly growing and this 1981 book attempts to make the theory more accessible to experimentalists Its primary purpose is to demonstrate to experimental molecular and cellular biologists the possible usefulness of mathematical models Biologists with a basic command of calculus should be able to learn from the book what assumptions are implied by various types of equations to understand in broad outline a number of major theoretical concepts and to be aware of some of the difficulties connected with analytical and numerical solutions of mathematical problems Thus they should be able to appreciate the significance of theoretical papers in their fields and to communicate usefully with theoreticians in the course of their work

Matlin, 2022-05-10 The difficulty of reconciling chemical mechanisms with the functions of whole living systems has plagued biologists since the development of cell theory in the nineteenth century As Karl Matlin argues in Crossing the Boundaries of Life it is no coincidence that this longstanding knot of scientific inquiry was loosened most meaningfully by the work of a cytologist the Nobel laureate Günter Blobel In 1975 using an experimental setup that did not contain any cells at all Blobel was able to synthesize proteins to theorize how proteins in the cell communicate spatially an idea he called signal hypothesis Over the next 20 years Blobel and other scientists were able to dissect this process into its precise molecular details For elaborating his signal concept into a process he termed membrane topogenesis the idea that each protein in the cell is synthesized with an address that directs the protein to its correct destination within the cell Blobel was awarded the Nobel Prize in Physiology or Medicine in 1999 Matlin argues that Blobel's investigative strategy and its subsequent application addressed the fundamental unresolved dilemma that had bedeviled biology from its very beginning allowing biology to overcome the barrier that had long blocked progress toward mechanistic explanations of life Crossing the Boundaries of Life thus uses Blobel's research and life story to shed light on the importance of cell biology for twentieth century science illustrating how it propelled the development of adjacent disciplines like biochemistry and molecular biology
