Molecular Basis Of The Immune Response

Molecular Basis Of The Immune Response:

Molecular Basis of the Immune Response Constantin A. Bona, New York Academy of Sciences, 1988-01-01 **Molecular Basis of Immune Responses** Hideo Nariuchi, 1993 *The Quantal Theory of Immunity* Kendall A. Smith, 2010 This book explains how the immune system functions namely how individual cells of the immune system make the decision to respond or not to respond to foreign microbes and molecules and how the critical molecules function to trigger the cellular reactions in an all or none quantal manner To date there has not been a complete description of the immune system and its cells and molecules primarily because most of the information has accumulated only in the last 40 years and our understanding has been expanding rapidly only in the last 20 years It is now clear that the cells have evolved a way to count the number of foreign antigenic molecular hits and they only react when a critical number of events have accumulated Subsequently control over the reaction is transferred to a systemic lymphocytotropic hormone system that determines the tempo magnitude and duration of the immune reaction This book explains in detail how the immune system cells and molecules work for the first time With this understanding as a basis the pathogenesis of autoimmunity can now be understood as a mutational usurpation of the genes encoding molecules that participate in a sensitive feedback regulatory control of the immune reaction By comparison malignant transformation is understood as a mutational usurpation of the genes encoding the molecules that control the quantal decision to proliferate so that normal ligand receptor cell growth control is circumvented This molecular understanding of the immune system is especially important for the design of successful vaccines and also explains why vaccines fail *The Molecular Basis of Human Cancer* William B. Coleman, Gregory J. Tsongalis, 2001-08-10 Internationally renowned basic and clinical scientists provide an account of our best current understanding of the genetics of cancer These authoritative contributors describe in detail each of the known molecular mechanisms governing neoplastic transformation in the breast prostate lung liver colon and skin and in the leukemias and lymphomas Their discussion illuminates both recent developments and established concepts in epidemiology molecular techniques oncogenesis and mutation mechanisms as well as the chemical viral and physical mechanisms in cancer induction *The Molecular Basis of B-Cell Differentiation and Function* M. Ferrarini, Benvenuto Pernis, 2013-03-09 The progress in protein and nucleic acid chemistry together with improvements of the previously employed tissue culture techniques have led to the solution of problems such as that of the generation of antibody diversity or of the molecular structure of T and B cell membrane receptor for antigen which had challenged the past generations of immunologists Thanks to this progress an impressive amount of knowledge has been accumulated on certain cell types that were relatively mysterious until recently The B lymphocyte represents a typical example of such a cell With these considerations in mind we have started to organize a NATO summer school on The molecular basis of B cell differentiation and function that had the specific aim of bringing up to date a selected number of young investigators During the course held in Santa Margherita Ligure October 1-11 1985 it became apparent that rather

than a formal school we had organized an informal series of Workshops where both the Faculty members and the participants were discussing their own data in addition to reviewing the general progress in the field The deep commitment of everyone to his research subject and the enthusiasm had caused this very successful change in the shape of the course At the end we asked the members of the Faculty and the participants to write a summary of their data and of their point of view on selected subjects

Molecular Basis of NK Cell Recognition and Function L. Moretta, 1996 Natural killer NK cells have been the subject of intense investigation Only in recent years however could the molecular mechanisms by which they lyse tumor or virus infected cells but spare normal cells be elucidated NK cells express different specialized receptors NK R specific for major histocompatibility complex MHC class I molecules These MHC molecules exert an inhibitory effect on NK cells i e lack of expression of one or more MHC class I alleles a common event in tumor or virus infected cells leads to NK mediated target cell lysis Recently NK type receptors have also been identified in a subset of T lymphocytes MHC NK R interaction causes inhibition of T cell activation and functions an observation which suggests a role for these receptors in the negative control of T cell responses This volume offers a complete and updated review of the signal transduction and functions of NK cells as well as their roles in transplantation anti tumor response and infectious diseases Written by experienced investigators who have contributed significantly to progress in the field this collection of reviews will be a valuable resource for basic and clinical immunologists hematologists oncologists and virologists
