Patterns Of Reproduction Of Four Species Of Vespertilionid Bats In Paraguay:

Patterns of Reproduction of Four Species of Vespertilionid Bats in Paraguay Philip Myers, 1977 Patterns of Reproduction of 4 Species of Vespertilionid Bats in Paraguay Philip Myers, *Asdell's Patterns of Mammalian Reproduction* Virginia Douglass Hayssen, Ari Van Tienhoven, Ans Van Tienhoven, 1993

Since the appearance of the second edition of Sydney A Asdell's widely used *Patterns of Mammalian Reproduction* in 1964 the field of reproductive physiology has expanded dramatically. Accordingly this revision adopts a different structure from previous editions substituting empirical delineations for physiological interpretations. With the emphases now on a presentation of the published facts of mammalian reproduction it provides a thorough compilation of what is known about the basic reproductive biology of each of the 4300 mammalian species. To gather information the authors examined more than 20 000 publications dating up to 1992. They used primary sources as much as possible supplementing them with English translations of Russian, Finnish, Chinese and Japanese journals. The data are presented in taxonomic order. Each familial account summarizes the pattern of reproduction for the family and provides lists of citations arranged by topic of the literature on the endocrinology, reproductive anatomy and reproductive physiology of the family. Following each account is a tabular listing of species specific data for neonatal mass and size, weaning mass and size, litter size, age at sexual maturity, estrous cycle length, gestation length, lactation length, number of litters per year and seasonality of reproduction. For each of these reproductive variables the range of data gleaned from the literature is given together with the source of each value listed.

Virginia Hayssen is Assistant Professor of Biology at Smith College. Ari Van Tienhoven is Professor of Animal Physiology Emeritus at Cornell University. Ans Van Tienhoven assisted in the compilation of data for the book.

Hormones and Reproduction of Vertebrates, Volume 5 David O. Norris, Kristin H. Lopez, 2024-08-08

Hormones and Reproduction of Vertebrates Volume 5 Mammals is the fifth of five second edition volumes representing a comprehensive and integrated overview of hormones and reproduction in fishes, amphibians, reptiles, birds and mammals. The book includes coverage of endocrinology, neuroendocrinology, physiology, behavior and anatomy of reptilian reproduction. It provides a broad treatment of the roles of pituitary, thyroid, adrenal and gonadal hormones in all aspects of reproduction as well as descriptions of major life history events. New to this edition is a concluding assessment of the effect of environmental influences on mammals. Initial chapters in this book broadly examine sex determination, reproductive neuroendocrinology, stress and hormonal regulation as it relates to male and female reproductive structure and function. Subsequent chapters introduce the evolution of viviparity and examine pregnancy in eutherian mammals, parturition, pheromones and behavioral neuroendocrinology. Covered taxa include rodents, bats and primates. The book concludes with an examination of the environmental influences on hormones and reproduction of mammals, including endocrine disrupting chemicals and climate change.

Hormones and Reproduction of Vertebrates Volume 5 Mammals is designed to provide a readable, coordinated description of reproductive basics in mammals as well as an introduction to the latest trends in

reproductive research and a presentation of our understanding of reproductive events gained over the past decade It may serve as a stand alone reference for researchers and practitioners in the field of mammology or as one of five coordinated references aligned to provide topical treatment across vertebrate taxa for researchers practitioners and students focused on vertebrate endocrinology Covers endocrinology neuroendocrinology physiology behavior and anatomy of mammalian reproduction Includes pituitary thyroid adrenal and gonadal hormones Focuses on rodents bats primates ungulates carnivores and marine mammals Provides new coverage on endocrine disrupting chemicals and climate change

Ecology of Bats T.H. Kunz, 2013-11-11 Among living vertebrates bats and birds are unique in their ability to fly and it is this common feature that sets them apart ecologically from other groups Bats are in some ways the nocturnal equivalents of birds having evolved and radiated into a diversity of forms to fill many of the same niches The evolution of flight and echolocation in bats was undoubtedly a prime mover in the diversification of feeding and roosting habits reproductive strategies and social behaviors Bats have successfully colonized almost every continental region on earth except Antarctica as well as many oceanic islands and archipelagos They comprise the second largest order of mammals next to rodents in number of species and probably exceed all other such groups in overall abundance Bats exhibit a dietary diversity including insects fruits leaves flowers nectar and pollen fish other vertebrates and blood unparalleled among other living mammals Their reproductive patterns range from seasonal monestry to polyestry and mating systems include promiscuity monogamy and polygyny The vast majority of what we know about the ecology of bats is derived from studies of only a few of the approximately 850 species yet in the past two decades studies on bats have escalated to a level where many important empirical patterns and processes have been identified This knowledge has strengthened our understanding of ecological relationships and encouraged hypothesis testing rather than perpetuated a catalog of miscellaneous observations

Hormones and Reproduction of Vertebrates David O. Norris, Kristin H. Lopez, 2010-11-25 This series of volumes represents a comprehensive and integrated treatment of reproduction in vertebrates from fishes of all sorts through mammals It is designed to provide a readable coordinated description of reproductive basics in each group of vertebrates as well as an introduction to the latest trends in reproductive research and our understanding of reproductive events Whereas each chapter and each volume is intended to stand alone as a review of that topic or vertebrate group respectively the volumes are prepared so as to provide a thorough topical treatment across the vertebrates Terminology has been standardized across the volumes to reduce confusion where multiple names exist in the literature and a comprehensive glossary of these terms and their alternative names is provided A complete essential and up to date reference for research scientists working on vertebrate hormones and reproduction and on animals as models in human reproductive research Covers the endocrinology neuroendocrinology physiology behaviour and anatomy of vertebrate reproduction Structured coverage of the major themes for all five vertebrate groups allows a consistent treatment for all Special chapters elaborate on features specific to individual

vertebrate groups and to comparative aspects similarities and differences between them *Reproductive Biology of Bats* Elizabeth G. Crichton, Philip H. Krutzsch, 2000-06-12 The *Reproductive Biology of Bats* presents the first comprehensive in depth review of the current knowledge and supporting literature concerning the behavior anatomy physiology and reproductive strategies of bats These mammals which occur world wide and comprise a vast assemblage of species have evolved unique and successful reproductive strategies through varied anatomical and physiological specialization These are accompanied by individual and or group behavioral interactions usually in response to environmental mechanisms essential to their reproductive success Is the first book devoted to the reproductive biology of bats Contains in depth reviews of the literature concerned with bat reproduction Contributors are widely recognized specialists Provides a powerful database for future research **Sperm Competition and the Evolution of Animal Mating systems** Robert L. Smith, 2012-12-02

Sperm Competition and the Evolution of Animal Mating Systems describes the role of sperm competition in selection on a range of attributes from gamete morphology to species mating systems This book is organized into 19 chapters and begins with the conceptualization of sperm competition as a subset of sexual selection and its implications for the insects The following chapter describes the relationship between multiple mating and female fitness with an emphasis on determining the conditions under which selection on females is likely to counteract selection on males for avoiding sperm competition Other chapters consider the female perspective on sperm competition the evolutionary causation at the level of the individual male gamete and the correlation of high paternal investment and sperm precedence in the insects The remaining chapters are arranged phylogenetically and explore the sperm competition in diverse animal taxa such as the *Drosophila* Lepidoptera spiders amphibians and reptiles These chapters also cover the evolution of direct versus indirect sperm transfer among the arachnids or the problem for kinship theory presented by multiple mating and sperm competition in the Hymenoptera This book further discusses the remarkable potential for sperm competition among certain temperate bat species whose females store sperm through winter hibernation and the mixed strategies and male caused female genital trauma as possible sperm competition adaptations in poeciliid fishes The concluding chapter examines the predictions concerning testes size and mating systems in the primates and the possible role of sperm competition in human selection This book is of great value to reproductive biologists and researchers **Bat Ecology** Thomas H. Kunz, M. Brock Fenton, 2005

In recent years researchers have discovered that bats play key roles in many ecosystems as insect predators seed dispersers and pollinators Bats also display astonishing ecological and evolutionary diversity and serve as important models for studies of a wide variety of topics including food webs biogeography and emerging diseases In *Bat Ecology* world renowned bat scholars present an up to date comprehensive and authoritative review of this ongoing research The first part of the book covers the life history and behavioral ecology of bats from migration to sperm competition and natural selection The next section focuses on functional ecology including ecomorphology feeding and physiology In the third section contributors explore macroecological issues

such as the evolution of ecological diversity range size and infectious diseases including rabies in bats A final chapter discusses conservation challenges facing these fascinating flying mammals Bat Ecology is the most comprehensive state of the field collection for scientists and researchers Contributors John D Altringham Robert M R Barclay Tenley M Conway Elizabeth R Dumont Peggy Eby Abigail C Entwistle Theodore H Fleming Patricia W Freeman Lawrence D Harder Gareth Jones Linda F Lumsden Gary F McCracken Sharon L Messenger Bruce D Patterson Paul A Racey Jens Rydell Charles E Rupprecht Nancy B Simmons Jean S Smith John R Speakman Richard D Stevens Elizabeth F Stockwell Sharon M Swartz Donald W Thomas Otto von Helversen Gerald S Wilkinson Michael R Willig York Winter **Bats of Puerto Rico** Michael R. Gannon, 2005 An interesting and enjoyable read Rich detail presented in well written logical fashion about the bat fauna of this interesting island Acta Chiropterologica The Caribbean islands are home to some of the most unusual species of bats A number of them are endemic living in no other region of the world On Puerto Rico alone thirteen different species have been found Bats are the only naturally occurring mammals there all others were introduced after settlement of the island first by the Ta no Indians and later by the Spanish Puerto Rico is important for study because of its human history tropical climate size relief and isolation from the mainland It is a useful model for understanding how historical geographic and environmental factors interact in a controlled environment to affect the diversity and complexity of its resident species This volume is the first complete compilation of the distribution natural history taxonomy and ecology of the bats of Puerto Rico The coauthors all experienced researchers introduce the book with a discussion of Puerto Rican ecosystems and an overview of facts and misconceptions about bats in general The main text provides detailed descriptions of each of the thirteen Puerto Rican species as well as illustrations of their faces and skulls The book concludes with keys to the characters of these bats and a complete glossary Maps show the distribution of each species on the island Bats of Puerto Rico is designed to be an easily used source of information for the general public as well as a complete descriptive record for ecologists mammalogists and wildlife biologists **Functional and Evolutionary Ecology of Bats** Akbar Zubaid, Gary F. McCracken, Thomas Kunz, 2006-01-05 Every three years a major international conference on bats draws the leading workers in the field to a carefully orchestrated presentation of the research and advances and current state of understanding of bat biology Bats are the second most populous group of mammalia species after rodents and they are probably the most intensively studied group of mammals Virtually all mammalogists and a large proportion of organismic biologists are interested in bats The earlier two edited books deriving from previous bat research conferences as well as this one have been rigorously edited by Tom Kunz and others with all chapters subjected to peer review The resulting volumes published first by Academic Press and most recently by Smithsonian have sold widely as the definitive synthetic treatments of current scientific understanding of bats *Wildlife Review* , 1983 Bats of Colima, Mexico Cornelio Sánchez-Hernández, María de Lourdes Romero-Almaraz, Gary D. Schnell, Michael L. Kennedy, Troy L. Best, Robert D. Owen, Sara B. González-Pérez, 2016-09-16 The tiny state of Colima on

Mexico's Pacific coast is one of the three most biodiverse hot spots in the world. Straddling temperate and tropical zones with rugged topography ranging from a volcanic mountaintop to sandy beaches, the state shelters nearly half of Mexico's species of Chiroptera or bats. In this volume, studded with more than 200 full color photographs and maps, a team of mammalogists from Mexico and the United States marshal information gathered over decades to present a comprehensive portrait of the bats of Colima. *Bats of Colima, Mexico* provides readers with the tools necessary to understand and identify each species of Colima's bat population from the sac-winged bats of family Emballonuridae to the mustached bats of family Mormoopidae. A dichotomous key indicates how each bat can be differentiated and describes the seven families within which they fall. The authors provide an in-depth description of each species including a photograph, a map of its distribution across Colima, and information on habitat, reproduction, conservation status, and more. By calling attention to Colima's rich chiropteran fauna, *Bats of Colima, Mexico* should not only foster interest in the rich biodiversity of the region but also nurture further collaboration between scientists and naturalists in the United States and Mexico. **North American Fauna**, 1982

Social Biology of the Bushy-tailed Woodrat, *Neotoma Cinerea* Peter C. Escherich, 1981 **Patterns of Vertebrate Biology** E.W. Jr. Jameson, 2012-12-06 This book grew from a series of lectures on vertebrate natural history. The topics have been developed over a period of nearly 30 years and today scarcely resemble the original subject matter. The progress is primarily technical. Some concepts provide a synthetic framework for viewing much modern research, but many of these concepts either date from Darwin or have developed from observations of later students. Animal science courses follow a sequential pattern in which there are three discrete levels of undergraduate instruction. Initially, students study subject matter contained in such courses as biology and general zoology. These courses introduce students to animal phylogeny, basic plans of morphology, and certain physiological aspects incidental to these subjects. The student acquires a broad zoological vocabulary. At the other end of the academic spectrum are courses that emphasize synthesis and theory. Evolution, zoogeography, behavior, and ecology are important courses whose role is to explore the relationships of various aspects of the physical and biological world. In these courses, theory and analysis prevail. They are not, however, essentially subject matter courses with distinct bodies of knowledge. **Walker's Bats of the World** Ronald M. Nowak, 1994-12 Valuable guide for general readers and an important reference for professionals. **University of California Publications in Zoology**, 1981

Bats John D. Altringham, 2011-08-25 Bats are highly charismatic and popular animals that are not only fascinating in their own right but illustrate most of the topical and important concepts and issues in mammalian biology. This book covers the key aspects of bat biology, including evolution, flight, echolocation, hibernation, reproduction, feeding, and roosting, ecology, social behaviour, migration, population, and community ecology, biogeography, and conservation. This new edition is fully updated and greatly expanded throughout, maintaining the depth and scientific rigour of the first edition. It is written with infectious enthusiasm and beautifully illustrated with drawings and colour photographs. *Proceedings of the Zoological Society*
