## **Rethinking Human Adaptation Biological And Cultural Models:**

Rethinking Human Adaptation Rada Dyson-hudson, Michael A. Little, Eric Alden Smith, 2019-06-26 Most anthropologists agree that a comprehension of adaptation and adaptive processes is central to an understanding of human biological and behavioural systems. However, there is little agreement among archaeologists, cultural anthropologists and human biologists as to what adaptation means and how it should be analyzed. Because of this lack of a common underlying theory, method and perspective, the subdisciplines have tended to move apart and anthropology is no longer the integrated science envisaged at its inception in the nineteenth century. In this book, the authors, both biological and cultural anthropologists, use a common theoretical framework based on recent evolutionary, ecological and anthropological theory in their analyses of biological and social adaptive systems. Although a synthesis of the subdisciplines of anthropology lies somewhere in the future, the original essays in this volume are a first attempt at a unified perspective.

**Evolutionary Ecology and Human Behavior** Eric Alden Smith, 2017-09-29 required reading for anyone interested in the economy, ecology and demography of human societies. American Journal of Human Biology. This excellent book can serve both as a textbook and as a scholarly reference. American Scientist.

Human Adaptive Strategies Daniel Bates, Judith Tucker, Ludomir Lozny, 2023-05-31 This book introduces students to cultural anthropology with an emphasis on environmental and evolutionary approaches focusing on how humans adapt to their environment and how the environment shapes culture. It shows how cultures evolve within the context of people's strategies for surviving and thriving in their environments. This approach is widely used among scholars as a cross-disciplinary tool that rewards students with valuable insights into contemporary developments. Drawing on anthropological case studies, the authors address immediate human concerns such as the costs and consequences of human energy requirements, environmental change and degradation, population pressure, social and economic equity and planned and unplanned change. Impacts of increasingly rapid climatic change on equitable access to resources and issues of human rights are discussed throughout. Towards the end of the book, the student is drawn into a challenging thought experiment addressing the possible impacts of climatic warming on Middle America in the year 2040. All chapters conclude with Summary, Key Terms and Suggested Readings. This book is an ideal text for students of introductory anthropology and archaeology, environmental studies, world history and human and cultural ecology courses.

**Building a New Biocultural Synthesis** Alan H. Goodman, Thomas Leland Leatherman, 2010-03-23 Anthropology, with its dual emphasis on biology and culture, is or should be the discipline most suited to the study of the complex interactions between these aspects of our lives. Unfortunately, since the early decades of this century, biological and cultural anthropology have grown distinct and a holistic vision of anthropology has suffered. This book brings culture and biology back together in new and refreshing ways. Directly addressing earlier criticisms of biological anthropology, *Building a New Biocultural Synthesis* concerns how culture and political economy affect human biology, e.g. people's nutritional status, the spread of disease, exposure to pollution and how

biological consequences might then have further effects on cultural social and economic systems Contributors to the volume offer case studies on health nutrition and violence among prehistoric and historical peoples in the Americas theoretical chapters on nonracial approaches to human variation and the development of critical humanistic and political ecological approaches in biocultural anthropology and explorations of biological conditions in contemporary societies in relationship to global changes Building a New Biocultural Synthesis will sharpen and enrich the relevance of anthropology for understanding a wide variety of struggles to cope with and combat persistent human suffering It should appeal to all anthropologists and be of interest to sister disciplines such as nutrition and sociology Alan H Goodman is Professor of Anthropology Hampshire College Thomas L Leatherman is Associate Professor of Anthropology University of South Carolina

Routledge is an imprint of Taylor Francis an informa company **Sexual Selection in Homo sapiens** Menelaos Apostolou, 2017-06-20 The present book aims to examine how sexual selection works in the human species Almost all scholarly effort focuses on sexual selection in non human species and extrapolates the findings to the human one However human mating has a unique pattern not found in any other species namely parental influence over mate choice Across preindustrial societies the typical pattern of long term mating is arranged marriage where parents choose spouses for their children By doing so parents effectively become a sexual selection force Traits that enhance an individual's chance to be selected as a son or a daughter in law confer important reproductive advantages to those who are endowed with them increasing in frequency in the population The author has coined the term parental choice to describe the sexual selection force that arises from parental control over mating He synthesizes extensive theoretical and empirical work in order to understand and model this force The aim is to understand which factors give rise to parental choice and to combine these insights into constructing a more formal model It also aims to further examine whether the predictions of the model fit the patterns of mating found across different types of human societies and how the model can be used to understand the evolution of behavioral traits involved in mating By synthesizing the various arguments put forward and published across the literature the book offers a comprehensive argument and overview of an aspect of sexual selection unique to our species Furthermore the book revises and extends previously made arguments and models while it provides useful insights on how the proposed revision of sexual selection theory can enable us to understand a wide range of human behavioral phenomena It

should be key reading for those interested in studying sexual selection in general and in the Homo sapiens species in particular *The Oxford Handbook of Evolutionary Perspectives on Violence, Homicide, and War* Todd K.

Shackelford, Viviana A. Weekes-Shackelford, 2012-08-23 This volume synthesizes the theoretical and empirical work of leading scholars in the evolutionary sciences to produce an extensive and authoritative review of this literature **Health and Lifestyle Change** Rebecca Huss-Ashmore, Joan Schall, Mary Hediger, 1992-06-29 The health impacts of changing behavior and lifestyle in a range of prehistoric historic and extant populations are examined in this volume Of particular interest to the authors is the identification of issues that link past and present and the ability of research on disease in the past to shed light on modern health problems MASCA Vol 9 **The Dilemma Of Amazonian Development** Emilio F Moran, 2019-05-28 This book the first to apply the combined approaches of anthropology geography ecology economics and sociology to the analysis of the Amazon River region and its imminent development explores the impact of development on Amazonian populations and the results of rural and urban growth strategies The authors use the methodologies of environment **Sociological Human Ecology** Michael Micklin, Harvey M Choldin, 2019-09-18 First published in This volume grew out of concerns raised by the contributors and a few others over the current status of human ecology within the field of sociology Stemming from conferences and subsequent discussions by a group of sociologist demographers on recent developments in sociological human ecology which started at the annual meeting of the Population Association of America in 1976 the original essays contained in this book are designed to review and assess the current state of knowledge in the field

**Human Population Biology** Michael A. Little, Jere D. Haas, 1989 This book is a careful integration of the social and biological sciences drawing on anthropology biology human ecology and medicine to provide a comprehensive understanding of how our species adapts to natural and man made environments Part I presents techniques to adapt and apply demographic methods to small populations particularly important for studying non Western populations Part II discusses the relationship of medical genetics to human adaptability and patterns of disease in non Western populations Part III covers capacity climatic stress and nutrition Part IV presents methods for growth assessment and prediction and addresses the topic of aging The final section Part V presents integrated case studies of human adaptation to high altitude and patterns of modernization and stress resulting from cultural change *Competition* P.A. Keddy, 2012-12-06 Competition is one of the most important factors controlling the distribution and abundance of living creatures Sperm cells racing up reproductive tracts beetle larvae battling inside single seeds birds defending territories and trees interfering with the light available to neighbours are all engaged in competition for limited resources Along with predation and mutualism competition is one of the three major biological forces that assemble living communities Recent experimental work much of it only from the last few decades has enhanced human knowledge of the prevalence of competition in nature There are acacia trees that use ants to damage vines beetles that compete in arenas for access to dung balls tadpoles that apparently poison their neighbours birds that smash the

eggs of potential competitors and plants that associate with fungi in order to increase access to soil resources While intended as an up to date reference work on the state of this branch of ecology the many non technical examples will make interesting reading for those with a general interest in nature Greatly expanded from the first prize winning edition there are entirely new chapters including one on resources and another on competition gradients in nature The author freely ranges across all major taxonomic groups in search of evidence The question of whether competition occurs is no longer useful the author maintains rather the challenge is to determine when and where each kind of competition is important in natural systems For this reason variants of competition such as intensity asymmetry and hierarchies are singled out for particular attention The book concludes with the difficulties of finding general principles in complex ecological communities and illustrates the limitations on knowledge that arise out of the biased conduct of scientists themselves Competition can be found elsewhere in living systems other than ecological communities at sub microscopic scales in the interactions of enzymes and neural pathways and over large geographic areas in the spread of human populations and contrasting ideas about the world Human societies are therefore also examined for evidence of the kinds of competition found among other living organisms Using an array of historical examples including Biblical conflicts the use of noblemen s sons in the Crusades the Viking raids in Europe strategic bombing campaigns in the Second World War and ethnic battles of the Balkans the book illustrates how most of the aspects of competition illustrated with plants and animals can be extended to the interactions of human beings and their societies

Military Review ,2017      *Professional Journal of the United States Army* ,2009-11      **How Third World Rural Households Adapt to Dietary Energy Stress** P. R. Payne,Michael Lipton,1994 Time and stress Sources and types of stress Biological responses to the stress environment Behavioral responses to the stress environment      *Genetic Seeds of Warfare* R. Paul Shaw,Yuwa Wong,2020-12-22 For millennia humanity has simultaneously deplored and waged war With each conflict the stakes have risen and we now face global annihilation for the sake of a practice all the world claims to condemn Is there some seemingly irresistible force that impels us toward our own destruction To explain this central paradox of human behaviour *Genetic Seeds of Warfare* originally published in 1989 advances a startling new theory It traces the origins of warfare back to early groups of Homo sapiens in competition for scarce resources showing that warfare evolved as these groups evolved kin group against kin group tribe against tribe nation against nation Rather than being tied to a specific gene warfare emerged as one of many behavioural strategies for maximising genetic survival As social groups became more complex motivations for warfare developed from simple protection of blood relations to political appeals to shared ethnicity religion and national identity But the ultimate cause of warfare is rooted in the most basic of human drives the need to ensure that one s genes will survive and reproduce The authors challenge many assumptions about human behaviour in general and warfare in particular They convincingly present the case for an evolutionary understanding of the propensity for warfare supporting their argument with data from a vast array of social and natural science research In doing so they reveal

why previous attempts at ending war have failed and make proactive suggestions toward the development of a new agenda for world peace

**Professional Generalism in a Hyper-specialised World** Nektarios Karanikas, 2025-04-01 This book challenges the notion that extreme professional expertise is the only path to success advocating instead for the concept of professional generalism as a complementary approach It brings together ideas from various disciplines offering insights relevant to all professionals regardless of specialisation The chapters of the book explore concepts and frameworks that are not typically discussed together in a single work and challenge the reader to test and contextualise them The book aims to inspire professionals to explore principles beyond their usual scope and to recognise opportunities to integrate concepts from other disciplines into their practice It encourages readers to consider how different approaches and perspectives can intersect and complement each other breaking down professional silos and fostering a more interconnected way of thinking Rather than promoting simplistic or middle ground solutions the book emphasises the value of considering diverse perspectives and approaches recognising that different contexts may require different paradigms It encourages readers to embrace complexity and diversity fostering a holistic and nuanced perspective essential for navigating today's interconnected professional landscapes

*Coevolution* William H. Durham, 1991 Charles Darwin's *On the Origins of Species* had two principal goals to show that species had not been separately created and to show that natural selection had been the main force behind their proliferation and descent from common ancestors In *Coevolution* the author proposes a powerful new theory of cultural evolution that is of the descent with modification of the shared conceptual systems we call cultures that is parallel in many ways to Darwin's theory of organic evolution The author suggests that a process of cultural selection or preservation by preference driven chiefly by choice or imposition depending on the circumstances has been the main but not exclusive force of cultural change He shows that this process gives rise to five major patterns or modes in which cultural change is at odds with genetic change Each of the five modes is discussed in some detail and its existence confirmed through one or more case studies chosen for their heuristic value the robustness of their data and their broader implications But *Coevolution* predicts not simply the existence of the five modes of gene culture relations it also predicts their relative importance in the ongoing dynamics of cultural change in particular cases The case studies themselves are lucid and innovative reexaminations of an array of oft pondered anthropological topics plural marriage sickle cell anemia blood type terms adult lactose absorption incest taboos headhunting and cannibalism In a general case the author's goal is to demonstrate that an evolutionary analysis of both genes and culture has much to contribute to our understanding of human diversity particularly behavioral diversity and thus to the resolution of age old questions about nature and nurture genes and culture

**Histories of Maize** John Staller, Robert Tykot, Bruce Benz, 2016-12-05 Maize has been described as a primary catalyst to complex sociocultural development in the Americas State of the art research on maize chronology molecular biology and stable carbon isotope research on ancient human diets have provided additional lines of evidence on the

changing role of maize through time and space and its spread throughout the Americas The multidisciplinary evidence from the social and biological sciences presented in this volume have generated a much more complex picture of the economic political and religious significance of maize The volume also includes ethnographic research on the uses and roles of maize in indigenous cultures and a linguistic section that includes chapters on indigenous folk taxonomies and the role and meaning of maize to the development of civilization Histories of Maize is the most comprehensive reference source on the botanical genetic archaeological and anthropological aspects of ancient maize published to date This book will appeal to a varied audience and have no titles competing with it because of its breadth and scope The volume offers a single source of high quality summary information unavailable elsewhere
