Endophytes of Forest Trees Anna Maria Pirttilä, A. Carolin Frank, 2018-06-19 Endophytes are commonly known as microorganisms mainly bacteria and fungi which live inside plant tissues without inducing symptoms Considering the long lived trees endophytes have a fundamental role in preparing their hosts to face extreme weather conditions drought heat cold and pathogen and herbivore attacks The current knowledge clearly demonstrates the importance of endophytes in shaping the plant diversity in a forest Endophytes have an important capacity for biocontrol of forest diseases Considering endophyte diversity and the range of various compounds and enzymes they can produce endophytes can be used for various biotechnological applications

Research Note NC., 1987 *General Technical Report NC.*, 1981 Host Plants of World Agrilus (Coleoptera, Buprestidae) Eduard Jendek, Janka Poláková, 2014-08-22 The beetle genus *Agrilus* has over 3000 species which makes it the most numerous in the Animal Kingdom Many species are serious pests of plants with high invasive potential Among them the notoriously known *Agrilus planipennis* invaded from Asia to North America where it killed tens of millions of ash trees caused regulatory agencies to enforce quarantines and cost municipalities property owners nursery operators and forest products industries tens of millions of dollars The monograph provides coherent comprehensive and critical review on all known host plants for more than 680 *Agrilus* species All host plants have assigned the confidence index from 0 3 based on the evaluated reliability which eliminates false records All original and subsequent references for particular plants are cited at each *Agrilus* species Data are organized from both insect and plant viewpoints Results are analyzed and illustrated by graphs and diagrams The main impact of the monograph is seen in entomology phytopathology forestry agriculture ecology and biocontrol

Developing Principles and Models for Sustainable Forestry in Sweden H.

Sverdrup, Ingrid Stjernquist, 2013-04-18 In this book is summarized those management principles that should be valid in areas where forests continuously are used for production where biodiversity aspects are important as well as economy and productivity and where demands on soil status and water quality are set Especially the very long term aspects are emphasized and it is shown how system model thinking is used to reach the goals Biogeochemical aspects are put forward as they are very important in areas on poor bedrock with acid soils Forest vitality and stress on trees are treated as well as the importance of wildlife and their effects of browsing The balance between social and recreational demands from the society and the economical needs of the landowner is of great concern Experiences from a special area in South Sweden are presented

Forest Microbiology Fred O Asiegbu, Andriy Kovalchuk, 2022-07-01 Forest Microbiology Volume Two Forest Tree Health highlights a range of emerging microbial phytopathogens of forest trees along with novel approaches for managing tree pests and diseases in a changing climate The book provides an overview of selected microbial pathogens of forest trees with an emphasis on their biology lifecycle spreading mechanisms impact on affected tree species and current and prospective control strategies At the same time the impact of tree microbiomes on host fitness is discussed Beneficial components of tree microbiota are presented along with their functional role in tree nutrition immunity and disease resistance In addition this volume addresses the many functions of microbial disease agents of trees including fungi bacteria viruses and phytoplasma Strong emphasis is placed on the genetics biochemistry physiology evolutionary biology and population dynamics of the microorganisms involved This title is a key resource for foresters and forest pathology practitioners as well as plant biologists Provides an overview of selected microbial pathogens of forest trees with an emphasis on their biology lifecycle spreading mechanisms impact on affected tree species and current and prospective control strategies Highlights novel approaches to managing tree pests and diseases in a changing climate Addresses the many functions of microbial disease agents of trees including fungi fungi bacteria viruses and phytoplasma

Recent Advances in Polyphenol Research, Volume 7 Jess Reed, Victor de Freitas, Stéphane Quideau, 2021-04-13 RECENT ADVANCES IN POLYPHENOL RESEARCH Plant polyphenols are secondary metabolites that constitute one of the most common and widespread groups of natural products They are essential plant components for adaptation to the environment and possess a large and diverse range of biological functions that provide many benefits to both plants and humans Polyphenols from their structurally simplest forms to their oligo polymeric versions i e tannin and lignin are phytoestrogens plant pigments antioxidants and structural components of the plant cell wall The interaction between tannins and proteins is involved in plant defense against predation cause astringency in foods and beverages and affect the nutritional and health properties of human and animal food plants This seventh volume of the highly regarded Recent Advances in Polyphenol Research series is edited by Jess Dreher Reed Victor Armando Pereira de Freitas and St phane Quideau and brings together chapters written by some of the leading experts working in the polyphenol sciences today Topics covered include Chemistry

Characterization of novel viruses in deciduous tree species in forests and public green spaces – case studies in Quercus robur and Fraxinus excelsior (Band 60) Marius Rehanek, The health of plants in general and deciduous trees in particular is influenced by a variety of factors including abiotic and biotic factors Uncountable harmful organisms can lead to a weakening of deciduous trees and shrubs in forests and urban green which are worth protecting due to their longevity and the invaluable ecosystem services they provide as well as their high economic value In this context plant viruses play a major role and must be considered Due to their ability to affect the host metabolism for the purpose of their own replication they can influence the vitality of trees change their susceptibility to other stress factors and thus lead to economic and ecological losses In recent years established technologies in the field of sequencing and bioinformatics have revealed the high abundance and enormous diversity of viruses in forest trees New viruses of the genus Emaravirus have been discovered in numerous hosts including herbaceous and woody plants Especially in deciduous trees emaraviruses have become the most widespread virus group causing diseases in important species of temperate and boreal forests In this doctoral thesis genetic and biological aspects of novel viruses were studied with special focus on the emerging group of emaraviruses Using the case studies common oak *Quercus robur* L and common ash *Fraxinus excelsior* L epidemiological studies revealed a wide distribution of common oak ringspot associated virus CORaV and ash shoestring associated virus ASaV in forest and urban trees CORaV and ASaV can be differentiated from other pathogens based on specific leaf symptoms With the help of a newly developed diagnostic ELISA CORaV can be reliably detected serologically in diseased oak trees A new species of rust mite is likely to be the vector for virus transmission Based on the results considering the composition of emaraviral accessory proteins the taxonomic order of the genus Emaravirus can be revised In addition to ASaV cytorhabdoviruses were shown to frequently infect common ash in natural and managed forest sites Genetic characterization provided evidence for two distinct cytorhabdovirus species affecting not only *Fraxinus excelsior* but also manna ash *Fraxinus ornus* and red ash *Fraxinus pennsylvanica* Applying High throughput sequencing HTS analyses sequence information about novel viruses belonging to different families have been revealed The doctoral thesis provides new insights into the diverse virome of deciduous trees thereby highlighting the demand for further studies on this fascinating group of pathogens Their characterization and interaction with other abiotic and biotic stressors may serve as a basis for better disease management
