ethical guidelines for the use of animals as test subjects and identifies irrational attitudes towards animals      *The Age of*  
*Stress* Mark Jackson,2016-11-17 We are living in a stressful world yet despite our familiarity with the notion stress remains  
an elusive concept In *The Age of Stress* Mark Jackson explores the history of scientific studies of stress in the modern world  
In particular he reveals how the science that legitimates and fuels current anxieties about stress has been shaped by a wide  
range of socio political and cultural as well as biological factors stress he argues is both a condition and a metaphor In order  
to understand the ubiquity and impact of stress in our own times or to explain how stress has commandeered such a central  
place in the modern imagination Jackson suggests that we need to comprehend not only the evolution of the medical science  
and technology that has gradually uncovered the biological pathways between stress and disease in recent decades but also  
the shifting social economic and cultural contexts that have invested that scientific knowledge with meaning and authority In  
particular he argues we need to acknowledge the manner in which enduring concerns about the effects of stress on mental  
and physical health are the product of broader historical preoccupations with the preservation of personal and political as  
well as physiological stability      *Handbook of Stress, Coping, and Health* Virginia Hill Rice,2000 Selected for inclusion in

### **The Resilient Voter**

Shauna Reilly, Stacy G. Ulbig, 2018-02-19 The Resilient Voter Stressful Polling Places and Voting Behavior provides a new perspective on the role voting barriers play demonstrating that they not only discourage participation but also affect the quality of votes cast Offering an interesting and unique approach to the study of voting barriers Shauna Reilly and Stacy G Ulbig investigate the possibility that complicated ballot language provisional voting and long polling place lines cause some voters to cast ballots in a manner contradictory to their preferences Building on arguments that stressful polling place conditions subject citizens to stress that can prevent them from casting complete ballots or even choosing to vote at all the authors ask whether those

who endure polling place frustrations and persevere to cast a ballot might become so stressed by their experience that they are unable to mark their ballots in a manner consistent with their standing policy preferences Using a creative experimental design the authors examine the ways in which complex ballot language registration difficulties and long polling place lines affect voters stress levels and how such anxieties translate into the willingness to cast a complete ballot and the ability to vote in a manner conforming to previously expressed preferences The authors demonstrate that even though most voters prove remarkably resilient in the face of some potentially stressful polling place barriers they are not immune to all polling place conditions Further they illustrate that some segments of the electorate tend to be more vulnerable to polling place stressors than others and illustrate the ways in which the compound effects of multiple barriers can exert an even wider impact

**Human Factors in Automated and Robotic Space Systems: Proceedings of a Symposium** ,1987-01-01

**Psychobiology of Stress** Stefano Puglisi-Allegra,A. Oliverio,2012-12-06 From a historical point of view the first studies on the response of the organism to stressful situations in general and on the psychobiology of stress in particular are probably those of Cannon and de la Paz the physiologists who showed in 1911 that the adrenal medulla and the sympathetic system are involved in emergency situations Cannon noted that the venous blood of cats frightened by barking dogs contained adrenaline a response of the organism which was prevented by adrenalectomy or by section of the splanchnic nerve innervating the adrenal medulla Cannon suggested that the adrenal medulla was acting in concert with the sympathetic nervous system so that both systems were activated during stress The role of the sympathetic system in response to stressful events was later emphasized by the experiments carried out by Maickel et al 1967 and by Mason 1968 these authors clearly showed that stressors activate the sympathetic system causing it to release adrenaline and noradrenaline This line of research may be contrasted with that carried out by Hans Selye centered on of the adrenal cortex in the stress response Selye s findings and theories originated the role the so called hypothalamic pituitary adrenal cortex HPA model of stress in short during stress adrenocorticotrophic hormone is released from cells of the anterior pituitary and elicits secretion of glucocorticoids from the adrenal cortex
