Proceedings ENTERFACE 2007
Similar, 2007 July 15 August 12 Bogazici University Campus eNTERFACE 07 took place in Istanbul at the campus of the Bogazici University The one month long workshop was attended by 140 people The workshop was organized around 12 well defined projects as the Vision, Modeling, and Visualization 2006 Leif Kobbelt, 2006 Summary These proceedings include

the contributions to the 11th international Workshop Vision Modeling and Visualization 2006 held in Aachen Germany The papers cover the following topics Image based Reconstruction Textures and Rendering GPU Programming Simulation and Visualization Image Processing Volume Visualization Geometry Processing and Rendering Publisher description **Image Blending Techniques and their Application in Underwater Mosaicing** Ricard Prados,Rafael Garcia,László Neumann,2014-04-05 This work proposes strategies and solutions to tackle the problem of building photo mosaics of very large underwater optical surveys presenting contributions to the image preprocessing enhancing and blending steps and resulting in an improved visual quality of the final photo mosaic The text opens with a comprehensive review of mosaicing and blending techniques before proposing an approach for large scale underwater image mosaicing and blending In the image preprocessing step a depth dependent illumination compensation function is used to solve the non uniform illumination appearance due to light attenuation For image enhancement the image contrast variability due to different acquisition altitudes is compensated using an adaptive contrast enhancement based on an image quality reference selected through a total variation criterion In the blending step a graph cut strategy operating in the image gradient domain over the overlapping regions is suggested Next an out of core blending strategy for very large scale photo mosaics is presented and tested on real data Finally the performance of the approach is evaluated and compared with other approaches

Data-driven Reflectance Acquisition and Modeling for Predictive Rendering Behnaz Kavoosighafi,2025-05-22 Recent developments in computer graphics and particularly within predictive rendering have enabled highly realistic simulations of object appearances While physically based reflectance PBR models offer widespread utility measured material reflectance data yields significantly higher accuracy through the direct empirical observation of complex light scattering interactions Nevertheless acquiring and modeling reflectance data entails substantial computational overhead This thesis investigates data driven approaches to improve the acquisition representation and rendering of reflectance data with a focus on predictive rendering to achieve precise and reliable visual simulations The first part of the thesis focuses on acquisition of Bidirectional Reflectance Distribution Function BRDF and Spatially Varying BRDF SVBRDF functions that describe light surface interactions at each point based on incoming and reflected light directions Lightweight setups are initially explored to enable efficient SVBRDF capture however their accuracy falls short for predictive rendering applications motivating the adoption of gonioscopic based setups To improve measurement efficiency of such setups a compressed sensing framework is introduced which incorporates a deterministic sampling strategy Additionally a unified formulation for sparse BRDF acquisition is presented allowing for the adaptation of sampling patterns and sample counts to the unique properties of each material This approach significantly enhances reconstruction quality while preserving the same sampling budget The second part of the thesis addresses modeling of reflectance measurements particularly the Bidirectional Texture Function BTF and BRDF Sparse representation techniques applied to existing BTF datasets prove effective in compressing texture data while

enabling real time rendering of the measured BTFs Despite these advances a discrepancy often arises between model space errors introduced during approximation and the image space errors perceived in rendered outputs To bridge this gap a systematic psychophysical experiment is performed to analyze the impact of BRDF modeling techniques on rendered material quality Building on these findings a neural metric is developed to evaluate perceptual accuracy directly in BRDF space This metric exhibits strong correlation with subjective human evaluations and presents the potential to guide BRDF fitting algorithms toward solutions that produce visually accurate and compelling renderings of real world materials **Advanced**
