Abstract. What are the most important problems of computational intelligence? A sketch of the road to intelligent systems is presented. Several experts have made interesting comments on the most challenging problems.

1 Introduction.

In the introduction to the “MIT Encyclopedia of Cognitive Sciences” M. Jordan and S. Russell [33] used the term “computational intelligence” to cover two views of artificial intelligence (AI): engineering and empirical science. Traditional AI started as an engineering discipline concerned with the creation of intelligent machines. Computational modeling of human intelligence is an empirical science. Both are based on computations.

Artificial Intelligence (AI) has established its identity quite early, during the Dartmouth conference in 1956 [6]. It had clearly defined goals, exemplified by great early projects, such as the General Problem Solver of Simon and Newell. There are many definitions of AI [48,64], for example: “... the science of making machines do things that would require intelligence if done by humans” (Marvin Minsky), “The study of how to make computers do things at which, at the moment, people are better” [48]. In essence AI tries to solve problems for which effective algorithms do not exist, using knowledge-based methods.

In the 1970-ties AI has contributed to the development of cognitive science and to the goal of creating “unified theories of cognition”, as Allen Newell called it. Ambitious theories of high cognitive functions were formalized by John Anderson in his Act* theory [3], and by Newell and his collaborators in the Soar theory [43]. Both were very successful and led to many practical (and commercial) applications. In the last decade intelligent agents become the focus of AI, entities that can perceive and act in a rational goal directed way to achieve some objectives.

Machine learning has been important from the beginning in AI. Samuel’s checker-playing system (1959) learned to play far superior checkers than its creator. Although initially research on perceptions has developed as a part of AI in the late 1950-ties machine learning became preoccupied with inductive, rule based knowledge [50]. AI development has always been predominately concerned with high-level cognition, where symbolic models are appropriate.

Peter Sincak, Jan Vascak, 2000-08-16 Computational intelligence integrates fields like neural networks fuzzy systems evolutionary computation and intelligent systems in general The new trends consist in the cooperation of various techniques into hybrid intelligent systems This multi author book with contributions from leading scientists as G Carpenter L Zadeh K Fukushima N Kasabov K Hirota H Takagi H Adeli B Igel'nik L Koczy J Kacprzyk C Moraga T Gedeon and many others presents interesting and promising aspects of the future of computational intelligence as an important part of intelligent information systems With a foreword written by J Bezdek who first published the notion of computational intelligence **Machine Intelligence. 1-** ,1967 *Computational Intelligence in Intelligent Data Analysis* Christian Moewes, Andreas Nürnberger, 2012-08-23 Complex systems and their phenomena are ubiquitous as they can be found in biology finance the humanities management sciences medicine physics and similar fields For many problems in these fields there are no conventional ways to mathematically or analytically solve them completely at low cost On the other hand nature already solved many optimization problems efficiently Computational intelligence attempts to mimic nature inspired problem solving strategies and methods These strategies can be used to study model and analyze complex systems such that it becomes feasible to handle them Key areas of computational intelligence are artificial neural networks evolutionary computation and fuzzy systems As only a few researchers in that field Rudolf Kruse has contributed in many important ways to the understanding modeling and application of computational intelligence methods On occasion of his 60th birthday a collection of original papers of leading researchers in the field of computational intelligence has been collected in this volume Computational Intelligence in Games Norio Baba, 2012-08-11 The most powerful computers in the world are not only used for scientific research defence and business but also in game playing Computer games are a multi billion dollar industry Recent advances in computational intelligence paradigms have generated tremendous interest among researchers in the theory and implementation of games Game theory is a branch of operational research dealing with decision theory in a competitive situation Game theory involves the mathematical calculations and heuristics to optimize the efficient lines of play This book presents a sample of the most recent research on the application of computational intelligence techniques in games This book contains 7 chapters The first chapter by Chen Fanelli Castellano and Jain is an introduction to

computational intelligence paradigms It presents the basics of the main constituents of computational intelligence paradigms including knowledge representation probability based approaches fuzzy logic neural networks genetic algorithms and rough sets In the second chapter Chellapilla and Fogel present the evolution of a neural network to play checkers without human expertise This chapter focuses on the use of a population of neural networks where each network serves as an evaluation function to describe the quality of the current board position After only a little more than 800 generations the evolutionary process has generated a neural network that can play checkers at the expert level as designated by the U.S. Chess Federation rating system The program developed by the authors has also competed well against commercially available software

Data Mining and Computational Intelligence Abraham Kandel, Mark Last, Horst Bunke, 2013-11-11 Many business decisions are made in the absence of complete information about the decision consequences Credit lines are approved without knowing the future behavior of the customers stocks are bought and sold without knowing their future prices parts are manufactured without knowing all the factors affecting their final quality etc All these cases can be categorized as decision making under uncertainty Decision makers human or automated can handle uncertainty in different ways Deferring the decision due to the lack of sufficient information may not be an option especially in real time systems Sometimes expert rules based on experience and intuition are used Decision tree is a popular form of representing a set of mutually exclusive rules An example of a two branch tree is if a credit applicant is a student approve otherwise decline Expert rules are usually based on some hidden assumptions which are trying to predict the decision consequences A hidden assumption of the last rule set is a student will be a profitable customer Since the direct predictions of the future may not be accurate a decision maker can consider using some information from the past The idea is to utilize the potential similarity between the patterns of the past e.g. most students used to be profitable and the patterns of the future e.g. students will be profitable

Computational and Ambient Intelligence Francisco Sandoval, Alberto Prieto, Joan Cabestany, Manuel Graña, 2007-09-21 This book constitutes the refereed proceedings of the 9th International Work Conference on Artificial Neural Networks IWANN 2007 held in San Sebastián Spain in June 2007 Coverage includes theoretical concepts and neurocomputational formulations evolutionary and genetic algorithms data analysis signal processing robotics and planning motor control as well as neural networks and other machine learning methods in cancer research

Artificial General Intelligence 2008 P. Wang, B. Goertzel, S. Franklin, 2008-02-18 The field of Artificial Intelligence AI was initially directly aimed at the construction of thinking machines that is computer systems with human like general intelligence But this task proved more difficult than expected As the years passed AI researchers gradually shifted focus to producing AI systems that intelligently approached specific tasks in relatively narrow domains In recent years however more and more AI researchers have recognized the necessity and the feasibility of returning to the original goal of the field Increasingly there is a call to focus less on highly specialized narrow AI problem solving systems and more on confronting the difficult issues involved in

creating human level intelligence and ultimately general intelligence that goes beyond the human level in various ways Artificial General Intelligence AGI as this renewed focus has come to be called attempts to study and reproduce intelligence as a whole in a domain independent way Encouraged by the recent success of several smaller scale AGI related meetings and special tracks at conferences the initiative to organize the very first international conference on AGI was taken with the goal to give researchers in the field an opportunity to present relevant research results and to exchange ideas on topics of common interest In this collection you will find the conference papers full length papers short position statements and also the papers presented in the post conference workshop on the sociocultural ethical and futurological implications of AGI
