Recent Advances in the Quantum Theory of Polymers Jean Marie André,1980 **Quantum Theory of Polymers as Solids** Janos J. Ladik,2012-12-06 The goal of this monograph is to summarize the different quantum mechanical methods developed in the last 20 years to treat the electronic structure of polymers Owing to the nature of the problem these methods consist of a mixture of quantum chemical and solid state physical techniques The theory described in Part I treats besides the Hartree Fock problem the electron correlation and it has also been developed for disordered polymeric systems Though for obvious reasons the book could not include all the existing calculations each new method described is illustrated by a few applications with a discussion of the numerical results obtained Far more details see the Introduction to Part I The second part contains the theoretical calculation of different properties of polymers based on the methods systematically introduced in the first part The properties calculated include the electronic and vibrational spectra of polymers and the computation of their transport magnetic and mechanical properties In cases where reliable experimental data are available the theoretical results are compared with them *Recent Advances in Liquid Crystalline Polymers* L. L. Chapoy,2012-12-06 This volume contains an eclectic collection of 22 papers on liquid crystalline polymers presented at the Sixth Polymer Workshop in the series sponsored by the European Science Foundation entitled Liquid Crystal Polymer Systems in Gentofte Denmark 12 14 September 1983 Since a contribution to this volume was strictly voluntary and in some cases represents a considerably expanded version of that which was presented it is strictly speaking not correct to term this a proceedings A description of the aims and purposes of the European Science Foundation with respect to the polymer area has been presented in Shell Polymers Vol 5 No 2 pp 34 35 1981 The papers given here represent a cross section of current research interests in liquid crystalline polymers in the areas of theory synthesis characterization structure property relationships and applications At least some of the current interest is motivated by attempts to practically exploit the novel properties of these materials in the developing technologies of high strength fibres and advanced materials for constructional purposes but also for functional materials in the areas of information retrieval electronics and optoelectronics applications The editor wishes to thank all those involved for their courtesy and cooperation *Quantum Chemistry of Polymers — Solid State Aspects* J. Ladik,J. André,M. Theoretical Chemistry C Thomson,2007-10-31 Specialist Periodical Reports provide systematic and detailed review coverage of progress in the major areas of chemical research Written by experts in their specialist fields the series creates a unique service for the active research chemist supplying regular critical in depth accounts of progress in particular areas of chemistry For over 90 years The Royal Society of Chemistry and its predecessor the Chemical Society have been publishing reports charting developments in chemistry which originally took the form of Annual Reports However by 1967 the whole spectrum of chemistry could no longer be contained within one volume and the series Specialist Periodical Reports was born The Annual Reports themselves still existed but were divided into two and subsequently three volumes covering Inorganic Organic and Physical Chemistry For more general coverage of the highlights in chemistry they remain a must Since that time the SPR series has altered according to the fluctuating degree of activity in various fields of chemistry Some titles have remained unchanged while others have altered their emphasis along with their titles some have been combined under a new name whereas others have had to be discontinued The current list of Specialist Periodical Reports can be seen on the inside flap of this volume

Recent Advances in Elastomeric Nanocomposites Vikas Mittal,Jin Kuk Kim,Kaushik Pal,2011-01-15 Recent Advances in Elastomeric Nanocomposites reviews the recent progresses in the synthesis processing as well as applications of elastomeric nanocomposites Elastomers are a very important class of polymer materials and the generation of their nanocomposites by the incorporation of nano filler has led to significant enhancement of their properties and hence expansion of their application potential Most of the studies related with these materials are present in the form of research papers Here the authors present a comprehensive text covering the whole of the subject The book is tailored more from the applications point of view but also provide enough introductory material for research scholars new to this field

One-Dimensional Organometallic Materials Michael C. Böhm,2012-12-06 This lecture note gives an analysis of electronic structure effects for a new class of molecular solids i e one dimensional organometal lic systems formed by transition met l atoms that are embedded in a matrix of macrocyclic organic ligands These systems as well as orga nic metals have focused considerable interest due to the potential formation of high mobility charge carriers For the present author it is difficult to participate in this restriction on a single physical property i e high electronic conductivities technical applications etc The lecture note is

hopefully a small contribution to enhance the general understanding of certain electronic properties in organo metallic polymers Those problems have been considered in the first place that seem to form a theoretical deficit in one specific field of solid state chemistry For the reader it will become evident that this contribution is a compromise always guided and limited by boundaries i An attempt to present problems to a chemical audience which have their roots in solid state physics ii The model calculations are limited by the currently available computational facilities This boundary implies that the computational data are subject to severe theoretical approximations iii Theorists have often a strong tendency to identify their numerical results and models with physical effects Also this lecture note is not free of this almost universal trend Nevertheless the author hopes that this text leads to some insight into a rather modern research field M e B6hm I

Molecular Semiconductors J. Simon,J.-J. Andre,2012-12-06 During the past thirty years considerable efforts have been made to design the synthesis and the study of molecular semiconductors Molecular semiconductors and more generally molecular materials involve interactions between individual subunits which can be separately synthesized Organic and metallo organic derivatives are the basis of most of the molecular materials A survey of the literature on molecular semiconductors leaves one rather confused It does seem to be very difficult to correlate the molecular structure of these semiconductors with their experimental electrical properties For inorganic materials a simple definition delimits a fairly homogeneous family If an inorganic material has a conductivity intermediate between that of an 10^{-12} insulator 10^{-10} cm and that of a metal 10^{-1} cm then it is a semiconductor and will exhibit the characteristic properties of this family such as junction formation photoconductivity and the photovoltaic effect For molecular compounds such simplicity is certainly not the case A huge number of molecular and macromolecular systems have been described which possess an intermediate conductivity However the various attempts which have been made to rationalize their properties have more often than not failed Even very basic electrical properties such as the mechanism of the charge carrier formation or the nature and the density of the dopants are not known in detail The study of molecular semiconductor junctions is very probably the most powerful approach to shed light on these problems Polydiacetylenes D. Bloor,R.R. Chance,2013-03-09 The polydiacetylenes are a class of polymers that are attrac ting increasing attention worldwide There are many reasons for this interest one of the most important being the availability of many polydiacetylenes as macroscopic high quality single crystals This fact was first reported in the pioneering work of Prof G Hegner on the solid state polymerization of disub stituted diacetylenes in the late 1960s Since then studies of the polymerization process and the properties of monomers and polymers have advanced understanding of solid state reactivity and the physiCS of quasi one dimensional materials More recently work on soluble polydiacetylenes gels and films has been of interest for both academic and technological reasons Progress in this area has required a combination of research disciplines ranging from synthetic organic chemistry to solid state physics The interdisciplinary effort required for success ful research in polydiacetylenes was reflected in the mix of chemists physicists and materials scientists who attended the Workshop The emerging potential for commercial applications of polydiacetylenes was also evident in the nearly equal partici pation of academic and industrial government scientists The WORKshop was the first major international meeting to focus solely on polydiacetylenes It provided a forum in which problems of mutual interest could be discussed by scientists with diverse backgrounds and interests It also satisfied the need

for a review of the science of these materials at a time when this basic understanding is leading to technological applications
