Selected Papers Of Kun Huang With Commentary:

Selected Papers Of Kun Huang (With Commentary) Bang-fen Zhu, 2000-04-19 Professor Kun Huang is widely known for his collaboration with Max Born in writing the classic monograph *Dynamical Theory of Crystal Lattices*. During his years of active research he has made many important contributions to solid state physics. The present collection of papers is selected at his own choice as representing his most influential works. Thus one finds included his pioneering work on the interaction of radiation field with polar lattices and the resulting coupled vibration modes later known as polariton; the systematic development of his theory of radiative and nonradiative multiphonon transition processes associated with lattice relaxation; his early prediction of diffuse X ray scattering due to crystal defects; and his recent research works on low dimensional semiconductor structures etc. Professor Huang has found by his experience that scientists interested in these papers often want to know more particulars underlying the research work: background, motivation and rationale involved etc. Thus he was led to write a commentary which is published alongside the papers. **Selected Papers (1945-1980), with Commentary** Chen Ning Yang, 2005 Consists of 73 articles and added items exclusively for this edition. [Adventures In Theoretical Physics: Selected Papers With Commentaries](#) Stephen L Adler, 2006-01-16 During the period 1964-1972 Stephen L Adler wrote seminal papers on high energy neutrino processes, current algebras, soft pion theorems, sum rules and perturbation theory anomalies that helped lay the foundations for our current standard model of elementary particle physics. These papers are reprinted here together with detailed historical commentaries describing how they evolved, their relation to other work in the field and their connection to recent literature. Later important work by Dr Adler on a wide range of topics in fundamental theory, phenomenology and numerical methods and their related historical background is also covered in the commentaries and reprints. This book will be a valuable resource for graduate students and researchers in the fields in which Dr Adler has worked and for historians of science studying physics in the final third of the twentieth century, a period in which an enduring synthesis was achieved. **Selected Papers (1945-1980) Of Chen Ning Yang (With Commentary)** Chen Ning Yang, 2005-08-22 A remarkable personal and professional chronicle by one of today's leading physicists: this is a collection of Chen Ning Yang's personally selected papers supplemented by his insightful commentaries. Including previously unpublished or hard to find works, this volume contains Yang's important papers on statistical physics, nuclear forces and particle physics. Among them are his seminal work with T D Lee on the nonconservation of parity for which they won the Nobel Prize and his work with R L Mills which led to modern gauge theories with their exciting prospects for the broad unification of field theories. The commentaries were written especially for this volume and provide a fascinating account of Yang's development as a physicist as well as a look at many important physicists of the 20th century. They trace the development of Yang's interests and ideas from his graduate school days to the present, showing how he worked with his colleagues and how their physics came into being. Together the papers and commentaries in this unique collection comprise a

powerful personal statement shedding light on both the intellectual development of a great physicist and on the nature of scientific inquiry *Selected Papers Of Richard Feynman (With Commentary)* Laurie M Brown, 2000-10-25 These scientific papers of Richard Feynman are renowned for their brilliant content and the author's striking original style They are grouped by topic path integral approach to the foundations of quantum mechanics and quantum field theory renormalized quantum electrodynamics theory of superfluid liquid helium theory of the Fermi interaction polarons gravitation partons computer theory etc Comments on Feynman's topics are provided by the editor together with biographical notes and a complete bibliography of Feynman's publications *Selected Works Of Emil Wolf (With Commentary)* Emil Wolf, 2001-06-04 This invaluable book presents most of the important papers of Emil Wolf published over half a century It covers chiefly diffraction theory especially the analysis of the focal region the theory of direct and inverse scattering phase space methods in quantum mechanics the foundation of radiometry phase conjugation and coherence theory Several papers which have become classics of the optical literature are included such as those on Wolf's rigorous formulation of the theory of partial coherence and partial polarization the introduction of diffraction tomography and his discovery of correlation induced shifts of spectral lines often called the Wolf effect There are also papers dealing with the historical development of optics and some review articles

Murray Gell-mann - Selected Papers Harald Fritzsch, 2010-02-08 Murray Gell Mann is one of the leading physicists of the world He was awarded the Nobel Prize in Physics in 1969 for his work on the classification and symmetries of elementary particles including the approximate SU 3 symmetry of hadrons His list of publications is impressive a number of his papers have become landmarks in physics In 1953 Gell Mann introduced the strangeness quantum number conserved by the strong and electromagnetic interactions but not by the weak interaction In 1954 he and F E Low proposed what was later called the renormalization group In 1958 he and R P Feynman wrote an important article on the V A theory of the weak interaction In 1961 and 1962 he described his ideas about the SU 3 symmetry of hadrons and its violation leading to the prediction of the particle In 1964 he proposed the quark picture of hadrons In 1971 he and H Fritzsch proposed the exactly conserved color quantum number and in 1972 they discussed what they later called quantum chromodynamics QCD the gauge theory of color These major publications and many others are collected in this volume providing physicists with easy access to much of Gell Mann's work Some of the articles are concerned with his recollections of the history of elementary particle physics in the third quarter of the twentieth century *Selected Papers of K C Chou* Yue-Liang Wu, 2009 This volume presents a collection of selected papers written by Prof Chou The papers are organized into four parts according to the subject of research areas and the language of publishing journals Part I in English and Part III in Chinese are papers on field theories particle physics and nuclear physics Part II in English and Part IV in Chinese are papers on statistical physics and condensed matter physics From the published papers it illustrates and is clearly evident how Prof Chou was constantly at the frontiers of theoretical physics in various periods and carried out creative research works experimenting with initial ideas and motivations as well as

how he has driven and worked in different key research directions of theoretical physics all for which he has made significant contributions to various interesting research areas and interdisciplinary fields

Quantum Mechanics In Phase Space: An Overview With Selected Papers Thomas L Curtright, David B Fairlie, Cosmas K Zachos, 2005-12-09 Wigner's quasi probability distribution function in phase space is a special Weyl representation of the density matrix It has been useful in describing quantum transport in quantum optics nuclear physics decoherence quantum computing and quantum chaos It is also important in signal processing and the mathematics of algebraic deformation A remarkable aspect of its internal logic pioneered by Groenewold and Moyal has only emerged in the last quarter century it furnishes a third alternative formulation of quantum mechanics independent of the conventional Hilbert space or path integral formulations In this logically complete and self standing formulation one need not choose sides coordinate or momentum space It works in full phase space accommodating the uncertainty principle and it offers unique insights into the classical limit of quantum theory This invaluable book is a collection of the seminal papers on the formulation with an introductory overview which provides a trail map for those papers an extensive bibliography and simple illustrations suitable for applications to a broad range of physics problems It can provide supplementary material for a beginning graduate course in quantum mechanics

Formation And Evolution Of Black Holes In The Galaxy: Selected Papers With Commentary Hans A Bethe, Gerald E Brown, Chang-hwan Lee, 2003-03-04 In published papers H A Bethe and G E Brown worked out the collapse of large stars and supernova explosions They went on to evolve binaries of compact stars finding that in the standard scenario the first formed neutron star always went into a black hole in common envelope evolution C H Lee joined them in the study of black hole binaries and gamma ray bursts They found the black holes to be the fossils of the gamma ray bursts From their properties they could reconstruct features of the burst and of the accompanying hypernova explosions This invaluable book contains 23 papers on astrophysics chiefly on compact objects written over 23 years The papers are accompanied by illuminating commentary In addition there is an appendix on kaon condensation which the editors believe to be relevant to the equation of

state in neutron stars and to explain why black holes are formed at relatively low masses Selected Papers of J. Robert Schrieffer John Robert Schrieffer, N. E.
