

SEMANTICS

Semantics is the branch of linguistics that deals with studying meaning in language. It examines the meaning of words, phrases, sentences, and language.

OVERVIEW

Semantics looks at literal and implied meanings, the connotations words may carry, and how these meanings can change across different contexts. It also studies the relationships between words and phrases, like synonymy (words with the same or similar meanings), antonymy (words with opposite meanings), and polysemy (words or phrases with multiple, related meanings).

EXAMPLE

Interpreting Irony: Irony refers to when someone says one thing but means another, often conveying implied criticism or sarcasm. For example, if someone says, "What a great day!" while standing in pouring rain, this would be ironic because it implies disappointment with the current situation despite saying otherwise through their words.

Semantic Similarity from Natural Language and Ontology Analysis Sébastien Harispe,Sylvie Ranwez,Stefan janaqi,Jacky Montmain,2022-05-31 Artificial Intelligence federates numerous scientific fields in the aim of developing machines able to assist human operators performing complex treatments most of which demand high cognitive skills e g learning or decision processes Central to this quest is to give machines the ability to estimate the likeness or similarity between things in the way human beings estimate the similarity between stimuli In this context this book focuses on semantic measures approaches designed for comparing semantic entities such as units of language e g words sentences or concepts and instances defined into knowledge bases The aim of these measures is to assess the similarity or relatedness of such semantic entities by taking into account their semantics i e their meaning intuitively the words tea and coffee which both refer to stimulating beverage will be estimated to be more semantically similar than the words toffee confection and coffee despite that the last pair has a higher syntactic similarity The two state of the art approaches for estimating and quantifying semantic similarities relatedness of semantic entities are presented in detail the first one relies on corpora analysis and is based on Natural Language Processing techniques and semantic models while the second is based on more or less formal computer readable and workable forms of knowledge such as semantic networks thesauri or ontologies Semantic measures are widely used today to compare units of language concepts instances or even resources indexed by them e g documents genes They are central elements of a large variety of Natural Language Processing applications and knowledge based treatments and have therefore naturally been subject to intensive and interdisciplinary research efforts during last decades Beyond a simple inventory and categorization of existing measures the aim of this monograph is to convey novices as well as researchers of these domains toward a better understanding of semantic similarity estimation and more generally semantic measures To this end we propose an in depth characterization of existing proposals by discussing their features the assumptions on which they are based and empirical results regarding their performance in particular applications By answering these questions and by providing a detailed discussion on the foundations of semantic measures our aim is to give the reader key knowledge required to i select the more relevant methods according to a particular usage context ii understand the challenges offered to this field of study iii distinguish room of improvements for state of the art approaches and iv stimulate creativity toward the development of new approaches In this aim several definitions theoretical and practical details as well as concrete applications are presented *The Future of Post-Human Semantics* Peter Baofu,2012-03-15 This seminal project aims to

fundamentally change the way we think about semantics from the combined perspectives of the mind nature society and culture with enormous implications for the human future and what the author originally called its post human fate

Understanding Semantics. A Textbook for Students of Linguistics and Translation Ali Alhaj, 2016-06 Semantics is a fascinating subject because it is cognition turning in upon itself This subject has also often seemed baffling with many different approaches to it Semantics is also an appealing subject because it is about how people make sense of each other linguistically but it can be a frustrating area of study because it requires us to make sense of people and what they have in mind Semantics is also a wide subject within the general study of language An understanding of semantics is essential to the study of language acquisition and of language change In this sense we can quote Holliday 1994 xvii who states A language is a system for making meanings a semantic system with other systems for encoding the meanings it produces The term semantics does not simply refer to the meaning of words it is the entire system of meanings of a language expressed by grammar as well as vocabulary The study of semantics includes the study of how meaning is constructed interpreted clarified obscured illustrated simplified negotiated contradicted and paraphrased The idea of this book on semantics initially grew out for the above considerations Moreover it will shed new light on a subject whose problems and obscurities have seemed inexhaustible Therefore it became necessary or in other words crucially imperative to produce publish and provide students and scholars with this treatise which may give an academic insight and practical approach

Syntax, the brain, and linguistic theory: a critical reassessment, 2024-07-23 Syntax refers both to the structure of sentences and the underlying combinatorial capacity to generate this structure For some time neurolinguistic research on syntax was heavily influenced by theoretical linguistic approaches which characterize in detail the nature of syntactic representations A rough consensus has been that the primary region supporting syntax is Broca's area and that syntactic deficits in aphasia exist primarily due to damage or degeneration of this region commonly occurring in Broca's aphasia and nonfluent agrammatic PPA With respect to temporal dynamics of syntactic processing neurophysiological research on syntax focused on specific event related potentials such as the ELAN and P600 thought to index phrase structure building and syntactic reanalyses However the research landscape has changed substantially in the last several years with new methodologies and theoretical perspectives and there is little consensus on the neurobiological foundations of syntax or the role of linguistic theory in guiding research The goal of this Research Topic is to reassess our understanding of syntax and the brain in light of these developments Specifically it is designed to address the following set of major questions
