Inorganic and Nutritional Aspects of Cancer G. Schrauzer, 2013-03-09 For many decades cancer research concentrated heavily on organic aspects of the disease and ignored the role of trace elements and minerals in carcinogenesis and tumor growth However in recent years spectacular progress has been made in inorganic cancer research numerous inorganic substances were shown to possess carcinogenic properties Quite unexpectedly certain coordination compounds of platinum were found to have powerful antineoplastic properties and a number of essential trace elements were demonstrated to have profound effects on the genesis and growth of spontaneous induced or transplanted tumors It therefore appeared desirable to call upon leading authorities in the field of inorganic cancer research to present their views in a conference dedicated specifically to their discipline But since trace elements are normal constituents of foods it seemed advantageous to include nutritional aspects into the program The fact that diet and nutrition influence tumor growth and development has been known or suspected for a long time However too little research has been done in this important field resulting in a serious retardation of knowledge Hence this opportunity to cover nutritional aspects of cancer was taken even though it was clear from the beginning that this broad field could not really be treated in the available time It was necessary for example to exclude entirely the vast area of nutrition as an adjuvant in cancer therapy and even then further limitation of the scope of topics to be covered had to be made
