Nicholas F Gray, 2020-08-17 Our rivers and lakes are continuously self purifying thanks to algal and bacterial biofilms that grow over the surface of stones and other debris This same process has been employed for over a century to treat our municipal and industrial wastewater in specially designed fixed film reactors that maximize this microbial activity by providing ideal growth conditions and unlimited food and oxygen Fixed film or attached biofilm reactors are unique in their ability to treat complex wastewaters and shock loadings using far less energy than other wastewater treatment processes such as activated sludge making them a sustainable treatment option Targeted at undergraduate and postgraduate engineers and scientists this book follows the structure of bestseller *Biology of Wastewater Treatment* This volume gives an expanded and up to date overview of the use of fixed film reactors in wastewater treatment with content spanning from biofilm formation to traditional trickling filters and rotating biological contactor technology advanced submerged systems including MBBRs and IFAS and their key role in the treatment of contaminated air and finally to nitrogen removal employing new microbial pathways such as Anammox This monograph emphasizes the biological aspects of the processes

Pharmaceutical Residues in the Environment Jolanta Kumirska, 2020-11-18 Pharmaceuticals due to their pseudo persistence and biological activity as well as their extensive use in human and veterinary medicine are a class of environmental contaminants that is of emerging concern In contrast to some conventional pollutants they are continuously delivered at low levels which might give rise to toxicity even without high persistence rates These chemicals are designed to have a specific physiological mode of action and to resist frequently inactivation before exerting their intended therapeutic effect These features among others result in the bioaccumulation of pharmaceuticals which are responsible for toxic effects in aquatic and terrestrial ecosystems It is extremely important to know how to remove them from the environment and or how to implement procedures or treatments resulting in their biological inactivation Although great advances have been made in their detection in aquatic matrices there remains limited analytical methodologies available for the trace analysis of target and non target pharmaceuticals in matrices such as soils sediments or biota There are still many gaps in the data on
