Perceptual Motor Learning:

Perceptual-motor Activities for Children Jill A. Johnstone, Molly Ramon, 2011 A guide that outlines a 32 week programme of sequential station activities that will help pre school and young school aged children in various stages of development particularly those who are lagging behind in their perceptual motor skills It provides what you need to create a perceptual motor learning laboratory for your students

The Learning, Memory, and Perception of Perceptual-motor Skills Robert B. Wilberg, 1991 Three main topics are covered in this book namely learning memory and perception The first section consists of seven papers and is devoted entirely to the learning of motor skills The papers summarize the current state of perceptual motor learning in general and highlight specific topics of interest to the informed reader The second section is divided between movement memory and perception In recent years there has been a decline in the popularity of movement memory as a research topic However some recent advances in cognitive science and parallel distributed processing in particular may now provide the basis for a renewed interest The topic of perception never enjoyed the popularity that motor skill learning and or memory for movement did However there is now a clearer understanding of the perceptual processes and invariances that affect how we perceive the world Others like the renewed interest in signal detection theory and quantal reaction time serve notice that the perceptual part of perceptual motor skills is here to stay

Recent insights into perceptual and motor skill learning (The computational and neural processes underlying perceptual and motor skill learning) Lior Shmuelof, John W Krakauer, 2015-03-18 Improvements in task performance following practice can occur as a result of changes in distinct cognitive and neural processes In some cases we can improve our performance by selecting a more successful behavior that is already part of our available repertoire Skill learning on the other hand refers to a slower process that results in improving the ability to perform a behavior i e it involves the acquisition of a behavior that was not available to the controller before training Skill learning can take place both in the sensory and in the motor domains Sensory skill acquisition in perceptual learning tasks is measured by improvements in sensory acuity through practice induced changes in the sensitivity of relevant neural networks Motor skill is harder to define as the term is used whenever a motor learning behavior improves along some dimension Nevertheless we have recently argued that as in perceptual learning acuity is an integral component in motor skill learning In this special topic we set out to integrate experimental and theoretical work on perceptual and motor skill learning

and to stimulate a discussion regarding the similarities and differences between these two kinds of learning
