The tercentenary of Marc Antoine Charpentier's death in 2004 stimulated a surge of activity on the part of performers and scholars confirming the modern assessment of Charpentier 1643-1704 as one of the most important and inventive composers of the French Baroque. The present book provides a snapshot of Charpentier scholarship in the early years of the new century. Its 13 chapters illustrate not only the sheer variety of strands currently pursued but also the way in which these strands frequently intertwine and generate the potential for future research. Between them they examine facets of the composer's compositional language and process, aspects of his performance practice and notation, the contexts within which he worked and the nature of his legacy. The appendix contains a transcription of the inventory of Charpentier's manuscripts prepared when their sale to the Royal Library was negotiated in 1726, an invaluable research tool. As numerous chapters in the book demonstrate, the wide variety of topics covered here will appeal both to readers interested in Charpentier's music and to those with a broader interest in the music and culture of the French Baroque, including aspects of patronage, church and theatre. Far from treating his output in isolation, this book places it in the wider context alongside such composers as Lully, Lalande, Marais, François Couperin and Rameau; it also views the composer in relation to his Italian training. In the process, the under-examined question of influence—who influenced Charpentier, whom did he influence—repeatedly comes to the fore. The book's Foreword was written by H. Wiley Hitchcock shortly before he died. Hitchcock's own part in raising the profile of Charpentier and his music to the level of recognition which it now enjoys cannot be emphasized enough. Appropriately, the volume is dedicated to his memory.

Gray, 2007-04-19 The field of cognitive modeling has progressed beyond modeling cognition in the context of simple laboratory tasks and begun to attack the problem of modeling it in more complex realistic environments such as those studied by researchers in the field of human factors. The problems that the cognitive modeling community is tackling focus on modeling certain problems of communication and control that arise when integrating with the external environment factors such as implicit and explicit knowledge, emotion, cognition, and the cognitive system. These problems must be solved in order to produce integrated cognitive models of moderately complex tasks. Architectures of cognition in these tasks focus on the control of a central system which includes control of the central processor itself, initiation of functional processes such as visual search and memory retrieval, and harvesting the results of these functional processes. Because the control of the central system is conceptually different from the internal control required by individual functional processes, a complete architecture of cognition must incorporate two types of theories of control: Type 1 theories of the structure, functionality, and operation of the controller, and type 2 theories of the internal control of functional processes, including how and what they communicate to the controller. This book presents the current state of the art for both types of theories, as well as contrasts among current approaches to human performance models. It will be an important resource for professional and student researchers in cognitive science, cognitive engineering, and human factors.
