DESCRIPTION

COPY LINK: <https://pdf.bookcenterapp.com/slide/1852332263> Providing performance guarantees is one of the most important issues for future telecommunication networks. This book describes theoretical developments in performance guarantees for telecommunication networks from the last decade. Written for the benefit of graduate students and scientists interested in telecommunications-network performance this book consists of two parts. The first introduces the recently-developed filtering theory for providing deterministic (hard) guarantees, such as bounded delay and queue length. The filtering theory is developed under the min-plus algebra, where one replaces the usual addition with the min operator and the usual multiplication with the addition operator. As in the classical linear system theory, the filtering theory treats an arrival process (or a departure process) as a signal and a network element as a system. Network elements, including traffic regulators and servers, can be modelled as linear filters under the min-plus algebra, and they can be joined by concatenation, "filter bank summation" and feedback to form a composite network element. The problem of providing deterministic guarantees is equivalent to finding the impulse response of composite network elements. This section contains material on:- (s, r)-calculus- Filtering theory for deterministic traffic regulation, service guarantees and networks with variable-length packets - Traffic specification- Networks with multiple inputs and outputs- Constrained traffic regulation The second part of the book addresses stochastic (soft) guarantees, focusing mainly on tail distributions of queue lengths and packet loss probabilities and contains material on:- (s(q), r(q))-calculus and q-envelope rates- The large deviation principle- The theory of effective bandwidthThe mathematical theory for stochastic guarantees is the theory of effective bandwidth. Based on the large deviation principle, the theory of effective bandwidth provides approximations for the bandwidths required to meet stochastic guarantees for both short-range dependent inputs and long-range dependent inputs.

NETWORKING 2002: Networking Technologies, Services, and Protocols; Performance of Computer and Communication Networks; Mobile and Wireless Communications Enrico Gregori, Marco Conti, Andrew T. Campbell, Guy Omidyar, Moshe Zukerman, 2007-06-30 This book constitutes the refereed proceedings of the Second IFIP TC6 Networking Conference. Networking 2002 was sponsored by the IFIP Working Groups 6.2, 6.3 and 6.8. For this reason the conference was structured into three tracks: i) Networking Technologies, Services and Protocols; ii) Performance of Computer and Communication Networks; and iii) Mobile and Wireless Communications. This year the conference received 314 submissions coming from 42 countries from all five continents: Africa 4, Asia 84, America 63, Europe 158, and Oceania 5. This represents a 50% increase in submissions over the first conference, thus indicating that Networking is becoming a reference conference for worldwide researchers in the networking community. With so many papers to choose from, the job of the Technical Program Committee to provide a conference program of the highest technical excellence was both challenging and time-consuming. From the 314 submissions we finally selected 82 full papers for presentation during the conference technical sessions. To give young researchers and researchers from emerging countries the opportunity to present their work and to receive useful feedback from participants, we decided to include two poster sessions during the technical program. Thirty-one short papers were selected for presentation during the poster sessions. The conference technical program was split into three days and included, in addition to the 82 refereed contributions, 5 invited papers from top-level researchers in the networking community.

High-performance Communication Networks Jean Walrand, Pravin Pratap Varaiya, 2000 Retaining the first edition's technology-centred perspective, this book gives readers a sound understanding of packet-switched, circuit-switched, and ATM networks and techniques for controlling them.
