Perioperative Chemotherapy Recent Results In Cancer Research Ser Vol 98:

Perioperative Chemotherapy U. Metzger, F. Largiader, H.-J. Senn, 2012-12-06 One reason for failure to cure solid tumors by surgery appears to be the impossibility of controlling metastases that are present but latent at the time of operation. This failure is a common clinical experience with aggressive neoplasms but it is not always appreciated in tumors with longer survival times e.g. breast and colon cancer. In addition, recent evidence indicates that after resection of a primary tumor, micrometastases from it might be enhanced by suppression of immune and reticuloendothelial functions of the host. Other factors such as increase of coagulability and stress in the perioperative period can also promote tumor growth. The development of new metastases might be facilitated by cells forced into the circulation during operative manipulations. Such events could be important for the outcome of treatment and it is suggested that preventive measures should be directed to this systemic component of solid tumors. Radical surgery can reduce the number of tumor cells to a subclinical 3.6 stage 10 to 10 cells in which chemotherapy might be more effective than in advanced stages. Chemotherapy on the other hand might aggravate the surgical morbidity by influencing the wound healing process by decreasing the immune response and or by toxicity to the bone marrow and to the gastrointestinal tract for example. *Journal of the National Cancer Institute*, 1992

Evidence-Based Oncology Christopher B. Williams, 2008-04-15 This is a book about using the best evidence to inform treatment decisions for people with cancer. It is written by oncologists for oncologists using examples throughout to illustrate key points. The book starts off with a toolbox section written in a way which will help those relatively new to the principles of evidence based oncology to understand the key issues and equip them with the basics of how to tell a good study from a bad one. The majority of the book then deals with an evidence based summary of the common and important cancers in a structured and easy to read format around common patient scenarios and frequently asked questions. Whilst most of the

evidence is based on randomised controlled trials other studies are cited where appropriate eg when discussing adverse events The unique accompanying book website will contain updates of new chapters and studies as they become available Written by leading world figures in the evidence based movement Includes free CD ROM with PC eBook and sample PDA chapter Methodology of reviewing and appraising evidence discussed in the context of cancer management Clinical sections covering prevention and screening Chapters on treatment of the individual major cancers review the current best available evidence to most frequently asked questions Rigorously structured explicit searches evidence of efficacy and harms plus comment around clinical scenarios Free access update website keeping the text current and live www.evidbasedoncology.com Journal of the National Cancer Institute, 2006 Summaries of papers contained in the journal accompany each issue

19 **High-Risk Breast Cancer** Joseph Ragaz, Irving M. Ariel, 2012-12-06 The many advances in breast cancer research as well as the large quantity of published material make it very difficult to gain insight into the global aspects of cancer management To follow and understand all the new developments is becoming a major challenge For this reason the editors decided to bring together a group of top researchers in breast cancer to provide a comprehensive yet readable conceptual review of the state of the art of breast cancer diagnosis and therapy The proposal to focus the review on the quantitative assessment of the risk at diagnosis the determination of which may permit selective therapies for individual patients was met with enthusiastic approval resulting in the present volume with contributions by the leading investigators in the field While the volume relating to diagnosis published recently focused on efforts leading to refinement at diagnosis of risk criteria sensitive enough to reliably distinguish the low and high risk categories the second volume by providing a review of the main problems and results of therapy given to high risk patients can be considered as a continuation of the first book A refined risk assessment at diagnosis and the application of the most suitable treatments to well selected individuals are the most important steps towards avoiding the present worrisome reality of overtreating the low risk and undertreating the high risk patients The first few chapters of the present volume offer an insight into the general management of early breast cancer
