Representation And Behavior:

Representation and Behavior Fred Keijzer, 2001-02-12 Keijzer provides a reconstruction of cognitive science's implicit representational explanation of behavior which he calls Agent Theory AT the use of mind as a subpersonal mechanism of behavior Representation is a fundamental concept within cognitive science Most often representations are interpreted as mental representations theoretical entities that are the bearers of meaning and the source of intentionality This approach views representation as the internal reflection of external circumstances that is as the end station of sensory processes that translate the environmental state of affairs into a set of mental representations Fred Keijzer stresses however that representations are also the starting point for a set of processes that lead back to the external environment They are used as theoretical components within an explanation of a person's outwardly visible behavior In this book Keijzer investigates the usefulness of representation for behavioral explanation irrespective of mental issues Viewing representation solely in terms of its contribution to explaining behavior allows him to build a serious case for a nonrepresentational approach and to evaluate representation's role in cognitive science Keijzer provides a reconstruction of cognitive science's implicit representational explanation of behavior which he calls Agent Theory AT AT is the use of mind as a subpersonal mechanism of behavior He proposes an alternative to AT called Behavioral Systems Theory BST which explains behavior as the result of interactions between an organism and its environment Keijzer compares BST to related work in the biology of cognition in the building of animal-like robots and in dynamical systems theory Most important he extends BST to the difficult issue of anticipatory behavior through an analogy between behavior and morphogenesis the process by which a multicellular body develops

Bruno Siciliano, Oussama Khatib, 2016-07-27 The second edition of this handbook provides a state of the art overview on the various aspects in the rapidly developing field of robotics Reaching for the human frontier robotics is vigorously engaged in the growing challenges of new emerging domains Interacting exploring and working with humans the new generation of robots will increasingly touch people and their lives The credible prospect of practical robots among humans is the result of the scientific endeavour of a half a century of robotic developments that established robotics as a modern scientific discipline The ongoing vibrant expansion and strong growth of the field during the last decade has fueled this second edition of the Springer Handbook of Robotics The first edition of the handbook soon became a landmark in robotics publishing and won the American Association of Publishers PROSE Award for Excellence in Physical Sciences Mathematics as well as the organization's Award for Engineering Technology The second edition of the handbook edited by two internationally renowned scientists with the support of an outstanding team of seven part editors and more than 200 authors continues to be an authoritative reference for robotics researchers newcomers to the field and scholars from related disciplines The contents have been restructured to achieve four main objectives the enlargement of foundational topics for robotics the enlightenment

of design of various types of robotic systems the extension of the treatment on robots moving in the environment and the enrichment of advanced robotics applications Further to an extensive update fifteen new chapters have been introduced on emerging topics and a new generation of authors have joined the handbook s team A novel addition to the second edition is a comprehensive collection of multimedia references to more than 700 videos which bring valuable insight into the contents The videos can be viewed directly augmented into the text with a smartphone or tablet using a unique and specially designed app Springer Handbook of Robotics Multimedia Extension Portal <http://handbookofrobotics.org>

Ten Lectures on Cognition, Mental Representation, and the Self Robert D. Rupert, 2023-05-01 These ten lectures articulate a distinctive vision of the structure and workings of the human mind drawing from research on embodied cognition as well as from historically more entrenched approaches to the study of human thought On the author s view multifarious materials co contribute to the production of virtually all forms of human behavior rendering implausible the idea that human action is best explained by processes taking place in an autonomous mental arena those in the conscious mind or occurring at the so called personal level Rather human behavior issues from a widely varied though nevertheless integrated collection of states and mechanisms the integrated nature of which is determined by a form of clustering in the components contributions to the production of intelligent behavior This package of resources the cognitive system is the human self Among its elements the cognitive system includes a vast number of representations many subsets of which share their content On the author s view redundancy of content itself constitutes an important explanatory quantity the greater the extent of content redundancy among representations that co contribute to the production of an instance of behavior the more fluid the behavior In the course of developing and applying these views the author addresses questions about the content of mental representations extended cognition the value of knowledge and group minds

The Mental Representation of Trait and Autobiographical Knowledge About the Self Thomas K. Srull, Robert S. Wyer, Jr., 2015-12-03 If there is one topic on which we all are experts it is ourselves Psychologists depend upon this expertise as asking people questions about themselves is an important means by which they gather the data that provide much of the evidence for psychological theory Personal recollections play an important role in clinical theorizing people s thoughts feelings and beliefs provide the principal data for attitudinal research and judgments of one s traits and descriptions of one s goals and motivations are essential for the study of personality Yet despite their long dependence on self report data psychologists know very little about this basic resource and the processes that govern it In spite of the importance of the self as a concept in psychology virtually no empirically tested representational models of self knowledge can be found Recently however several theoretical accounts of the representation of self knowledge have been proposed These models have been concerned primarily with the factors underlying a particular type of self knowledge our trait conceptions of ourselves The models all share the starting assumption that the source of our knowledge

of the traits that describe us is memory for our past behavior The lead article in this volume reviews the available models of the processes underlying trait self descriptiveness judgments Although these models appear quite different in their basic representational assumptions exemplar and abstraction models sometimes are difficult to distinguish experimentally Presenting a series of studies using several new techniques which the authors believe are effective for assessing whether people recruit specific exemplars or abstract trait summaries when making trait judgments about themselves they conclude that specific behavioral exemplars play a far smaller role in the representation of trait knowledge than previously has been assumed Finally the limitations of social cognition paradigms as methods for studying the representation of long term social knowledge are discussed and the implications of the research for both existing and future social psychological research are explored

Cognitive Biology Gennaro Auletta,2011-07-14 Providing a new conceptual scaffold for further research in biology and cognition this book introduces the new field of Cognitive Biology a systems biology approach showing that further progress in this field will depend on a deep recognition of developmental processes as well as on the consideration of the developed organism as an agent able to modify and control its surrounding environment The role of cognition the means through which the organism is able to cope with its environment cannot be underestimated In particular it is shown that this activity is grounded on a theory of information based on Bayesian probabilities The organism is considered as a cybernetic system able to integrate a processor as a source of variety the genetic system a regulator of its own homeostasis the metabolic system and a selecting system separating the self from the non self the membrane in unicellular organisms Any organism is a complex system that can survive only if it is able to maintain its internal order against the spontaneous tendency towards disruption Therefore it is forced to monitor and control its environment and so to establish feedback circuits resulting in co adaptation Cognitive and biological processes are shown to be inseparable
