Brown Adipose Tissue Functions and Browning Phenomenon Rita De Matteis, Paula Oliver, Assunta Lombardi, 2020-04-20 *Thermal Biology* Makoto Tominaga, Masahiro Takagi, 2024-09-17 This book concerns two subthemes temperature sensing and temperature responding systems addressing the questions of how temperature is sensed and how temperature is related to biological functions respectively Temperature affects various physiological functions and is one of the most important factors in homeostasis The book seeks to integrate our understanding of temperature dependent biological phenomena with the development of techniques that detect and regulate local temperatures in cells and organs with high resolution and precision Part I Temperature sensing addresses temperature sensing mechanisms by focusing on plasma membrane molecules intracellular molecules and intracellular metabolic pathways This part seeks to develop ways to detect and regulate local temperatures at a cellular level which would facilitate future temperature sensing research Part II Temperature responding systems focuses on the neural circuits that integrate information concerning ambient temperature sensation the effects of temperature on metabolic functions and biological rhythms and mechanisms involved in emotion formation This part clarifies crosstalk between temperature responding systems by developing methods to detect and regulate local temperatures in organs Authors of this book are leading researchers investigating temperature sensing mechanisms across a wide range of biological responses from molecular to whole organism levels The book promotes an integrated understanding of temperature dependent biological phenomena under a novel discipline thermal biology which leads to a novel concept wherein temperature as a physical quantity could be viewed as an element of new signaling mechanisms *Biology and therapeutic potential of brown adipose tissue* Patrick Seale, 2013-06-03 Brown adipose tissue BAT has long been recognized as a key thermogenic tissue in eutherian mammals Brown fat cells contain large numbers of highly specialized mitochondria that oxidize fat and carbohydrate to produce heat This metabolic inefficiency is due to the

presence of Ucp1 in the inner mitochondrial membrane of brown fat cells which dissociates the electrochemical gradient from ATP production BAT presumably evolved to protect animals against hypothermia in response to cold exposure However energy expended by BAT has the added benefit of counteracting obesity and associated metabolic disease at least in rodents A very large number of studies have consistently shown that mice carrying increased amounts of active brown fat are lean and healthy Until recently it was generally believed that the amount of brown fat tissue was negligible in healthy adult humans However PET imaging studies have refuted this notion and revealed the existence of active BAT in most if not all adult humans Notably there is a very strong inverse correlation between the amount of activated BAT and fatness in humans Moreover activated brown fat is lost with ageing which also correlates with tendency to gain weight The field must now address whether variation in brown fat activity is a cause or consequence of weight gain Brown fat cells are localized in discrete depots of BAT and are also found as clusters interspersed in white fat tissues The prevalence and function of these so called brite brown in white cells in humans remains unknown The development of strategies to increase the amount and or activity of brown fat may hold exciting prospects for the treatment of obesity and its associated health consequences In this Research Topics issue we would propose to examine the following areas related to brown fat biology 1 Development of brown and brite cells including historical evolutionary perspective transcriptional pathways developmental origins 2 Pathways that influence brown fat cell development BMP7 TZDs Prostaglandins FGF21 3 Activation of brown fat focus on sympathetic and sensory innervation signaling by beta adrenergic receptors nerve fat connections 4 Brown fat thermogenesis in response to cold diet and hibernation 5 Brown fat in humans including human brown fat precursors methods for imaging factors that influence prevalence relationship between body mass obesity and amount of brown fat 6 Brown fat mitochondria including mechanism of uncoupling Ucp1 history structure function mitochondrial biogenesis *The Colorado School Journal*

Kaltashov, Albert D. Windhorst, 2017-08-08 The discovery and development of a biological active molecule with therapeutic properties is an ever increasing complex task highly unpredictable at the early stages and marked in the end by high rates of failure As a consequence the overall process leading to the production of a successful drug is very costly The improvement of the net outcome in drug discovery and development would require amongst other important factors a good understanding of the molecular events that characterize the disease or pathology in order to better identify likely targets of interest to optimize the interaction of an active agent small molecule or macromolecule of natural or synthetic origin with those targets and to facilitate the study of the pharmacokinetics pharmacodynamics and toxicity of an active agent in suitable models and in human subjects The objective of this Research Topic is to highlight new developments and applications of imaging

techniques with the objective of performing pharmacological studies in vivo in animal models and in humans In the domain of drug discovery the pharmacological and biomedical questions constitute the center of attention In this sense it is fundamental to keep in mind the strengths and limitations of each analytical or imaging technique At the end the judicious application of the technique with the aim of supporting the search for answers to manifold questions arising during a long and painstaking path provides a continuous role for imaging within the complex area of drug discovery and development
