Natural Operations In Differential Geometry:

Natural Operations in Differential Geometry Ivan Kolar, Peter W. Michor, Jan Slovák, 1993-01-22 The literature on natural bundles and natural operators in differential geometry was until now scattered in the mathematical journal literature This book is the first monograph on the subject collecting this material in a unified presentation The book begins with an introduction to differential geometry stressing naturality and functionality and the general theory of connections on arbitrary fibered manifolds The functional approach to classical natural bundles is extended to a large class of geometrically interesting categories Several methods of finding all natural operators are given and these are identified for many concrete geometric problems After reduction each problem to a finite order setting the remaining discussion is based on properties of jet spaces and the basic structures from the theory of jets are therefore described here too in a self contained manner The relations of these geometric problems to corresponding questions in mathematical physics are brought out in several places in the book and it closes with a very comprehensive bibliography of over 300 items This book is a timely addition to literature filling the gap that existed here and will be a standard reference on natural operators for the next few years

geometry through complex geometry including holomorphic symplectic and poisson geometry to differential geometry with an emphasis on curvature flows and topology

Differential Geometry, Lie Groups and Symmetric Spaces over General Base Fields and Rings Wolfgang Bertram, 2008 The aim of this work is to lay the foundations of differential geometry and Lie theory over the general class of topological base fields and rings for which a differential calculus has been developed without any restriction on the dimension or on the characteristic Two basic features distinguish the author's approach from the classical real finite or infinite dimensional theory namely the interpretation of tangent and jet functors as functors of scalar extensions and the introduction of multilinear bundles and multilinear connections which generalize the concept of vector bundles and linear connections

Introduction to Global Variational Geometry Demeter Krupka, 2015-01-13 The book is devoted to recent research in the global variational theory on smooth manifolds Its main objective is an extension of the classical variational calculus on Euclidean spaces to topologically nontrivial finite dimensional smooth manifolds to this purpose the methods of global analysis of differential forms are used Emphasis is placed on the foundations of the theory of variational functionals on fibered manifolds relevant geometric structures for variational principles in geometry physical field theory and higher order fibered mechanics The book chapters include foundations of jet bundles and analysis of differential forms and vector fields on jet bundles the theory of higher order integral variational functionals for sections of a fibred space the global first variational formula in infinitesimal and integral forms extremal conditions and the discussion of Noether symmetries and generalizations the inverse problems of the calculus of variations of Helmholtz type variational sequence theory and its consequences for the global inverse problem cohomology conditions examples of variational functionals of mathematical physics Complete formulations and proofs of all basic assertions are given based on theorems of global analysis explained in the Appendix

An Alternative Approach to Lie Groups and Geometric Structures Ercüment H. Ortaçgil, 2018-06-28 This book presents a new and innovative approach to Lie groups and differential geometry Rather than compiling and reviewing the existing material on this classical subject Professor Ortaçgil instead questions the foundations of the subject and proposes a new direction Aimed at the curious and courageous mathematician this book aims to provoke further debate and inspire further development of this original research

New Lagrangian and Hamiltonian Methods in Field Theory G. Giachetta, L. Mangiarotti, Gennadiy Aleksandrovich Sardanashvili, 1997 This book incorporates 3 modern aspects of mathematical physics the jet methods in differential geometry Lagrangian formalism on jet manifolds and the multimomentum approach to Hamiltonian formalism Several contemporary field models are investigated in detail This is not a book on differential geometry However modern concepts of differential geometry such as jet manifolds and connections are used throughout the book Quadratic Lagrangians and Hamiltonians are studied at the general level including a treatment of Hamiltonian formalism on composite fiber manifolds The book presents new geometric methods and results in field theory

Connections in Classical and Quantum Field

Theory L. Mangiarotti, Gennadi Aleksandrovich Sardanashvili, 2000 Geometrical notions and methods play an important role in both classical and quantum field theory and a connection is a deep structure which apparently underlies the gauge theoretical models in field theory and mechanics This book is an encyclopaedia of modern geometric methods in theoretical physics It collects together the basic mathematical facts about various types of connections and provides a detailed exposition of relevant physical applications It discusses the modern issues concerning the gauge theories of fundamental fields The authors have tried to give all the necessary mathematical background thus making the book self contained This book should be useful to graduate students physicists and mathematicians who are interested in the issue of deep interrelations between theoretical physics and geometry

Geometric Analysis on Real Analytic Manifolds Andrew D. Lewis, 2023-11-07 This monograph provides some useful tools for performing global geometric analysis on real analytic manifolds At the core of the methodology of the book is a variety of descriptions for the topologies for the space of real analytic sections of a real analytic vector bundle and for the space of real analytic mappings between real analytic manifolds Among the various descriptions for these topologies is a development of geometric seminorms for the space of real analytic sections To illustrate the techniques in the book a number of fundamental constructions in differential geometry are shown to induce continuous mappings on spaces of real analytic sections and mappings Aimed at researchers at the level of Doctoral students and above the book introduces the reader to the challenges and opportunities of real analytic analysis and geometry

Cycle Spaces of Flag Domains Gregor Fels, Alan Huckleberry, Joseph A. Wolf, 2006-07-30 This research monograph is a systematic exposition of the background methods and recent results in the theory of cycle spaces of ag domains Some of the methods are now standard but many are new The exposition is carried out from the viewpoint of complex algebraic and differential geometry Except for certain foundational material which is readily available from standard texts it is essentially self contained at points where this is not the case we give extensive references After developing the background material on complex ag manifolds and representation theory we give an exposition with a number of new results of the complex geometric methods that lead to our characterizations of group theoretically defined cycle spaces and to a number of consequences Then we give a brief indication of just how those results are related to the representation theory of semisimple Lie groups through for example the theory of double bration transforms and we indicate the connection to the variation of Hodge structure Finally we work out detailed local descriptions of the relevant full Barlet cycle spaces Cycle space theory is a basic chapter in complex analysis Since the 1960s its importance has been underlined by its role in the geometry of ag domains and by applications in the representation theory of semisimple Lie groups This developed very slowly until a few years ago when methods of complex geometry in particular those involving Schubert slices Schubert domains Iwasawa domains and supporting hypersurfaces were introduced In the late 1990s and continuing through early 2002 we developed those methods and used them to give a precise description of cycle spaces for ag domains This effectively

enabled the use of double bration transforms in all ag domain situations Noether's Theorems Gennadi Sardanashvily,2016-03-18 The book provides a detailed exposition of the calculus of variations on fibre bundles and graded manifolds It presents applications in such area s as non relativistic mechanics gauge theory gravitation theory and topological field theory with emphasis on energy and energy momentum conservation laws Within this general context the first and second Noether theorems are treated in the very general setting of reducible degenerate graded Lagrangian theory

Gauge Mechanics Luigi Mangiarotti,Gennadi A Sardanashvily,1998-12-07 This book presents in a unified way modern geometric methods in analytical mechanics based on the application of fibre bundles jet manifold formalism and the related concept of connection Non relativistic mechanics is seen as a particular field theory over a one dimensional base In fact the concept of connection is the major link throughout the book In the gauge scheme of mechanics connections appear as reference frames dynamic equations and in Lagrangian and Hamiltonian formalisms Inertial forces energy conservation laws and other phenomena related to reference frames are analyzed that leads us to observable physics Special topics on relativistic mechanics geometric BRST mechanics frame dependent quantization and others together with many examples are also dealt with *Algebra, Geometry and Mathematical Physics* Abdenacer Makhlouf,Eugen Paal,Sergei D.

Silvestrov,Alexander Stolin,2014-06-17 This book collects the proceedings of the Algebra Geometry and Mathematical Physics Conference held at the University of Haute Alsace France October 2011 Organized in the four areas of algebra geometry dynamical symmetries and conservation laws and mathematical physics and applications the book covers deformation theory and quantization Hom algebras and n ary algebraic structures Hopf algebra integrable systems and related math structures jet theory and Weil bundles Lie theory and applications non commutative and Lie algebra and more The papers explore the interplay between research in contemporary mathematics and physics concerned with generalizations of the main structures of Lie theory aimed at quantization and discrete and non commutative extensions of differential calculus and geometry non associative structures actions of groups and semi groups non commutative dynamics non commutative geometry and applications in physics and beyond The book benefits a broad audience of researchers and advanced students *Stochastic Analysis and Applications* Fred Espen Benth,Giulia Di Nunno,Tom Lindstrom,Bernt Øksendal,Tusheng Zhang,2007-04-24 Kiyosi Ito the founder of stochastic calculus is one of the few central figures of the twentieth century mathematics who reshaped the mathematical world Today stochastic calculus is a central research field with applications in several other mathematical disciplines for example physics engineering biology economics and finance The Abel Symposium 2005 was organized as a tribute to the work of Kiyosi Ito on the occasion of his 90th birthday Distinguished researchers from all over the world were invited to present the newest developments within the exciting and fast growing field of stochastic analysis The present volume combines both papers from the invited speakers and contributions by the presenting lecturers A special feature is the Memoirs that Kiyoshi Ito wrote for this occasion These are
