Perceptual And Cognitive Development:

Perceptual and Cognitive Development Rochel Gelman, Terry Kit-Fong Au, 1996-06-17 Perceptual and Cognitive Development illustrates how the developmental approach yields fundamental contributions to our understanding of perception and cognition as a whole The book discusses how to relate developmental comparative and neurological considerations to early learning and development and it presents fundamental problems in cognition and language such as the acquisition of a coherent organized and shared understanding of concepts and language Discussions of learning memory attention and problem solving are embedded within specific accounts of the neurological status of developing minds and the nature of knowledge Research advances and theoretical reorientations are updated in the Second Edition the revision focuses more attention on the cognitive and biological sciences and neuroscience Illustrates how the developmental approach can yield fundamental contributions to our understanding of perception and cognition as a whole Discussions of learning memory and attention permeate individual chapters *Developmental Psychology: Perceptual and cognitive development. pt.1. J. Gavin Bremner, Charlie Lewis, 2005 Infant Perception and Cognition Lisa M. Oakes, 2011 The cognitive revolution in the 1950s and 1960s led researchers to view the human mind like a computer as an information processing system that encodes represents and stores information and is constrained by limits on hardware the brain and software learning strategies and rules The emergence of new behavioral computational and neuroscience methodologies has deeply expanded psychologists understanding of the workings of the infant child and adult mind One result is that research has focused on mechanisms of change over developmental time in the information processing mind In this book Lisa Oakes Cara Cashon Marianella Casasola and David Rakison bring together the recent findings and theories about the origins and early development of the information processing mind and provide insight into the future directions in the study of infant perception and cognition The contributors represent a wide range of research areas in the study of infant perception and cognition who emphasize the use of diverse methodological techniques to address key questions about development Their chapters demonstrate how the combination of historical perspectives on the information processing approach to cognition and recent advances in behavioral computational and neuroscience approaches to cognition has contributed to our understanding of how abilities ranging from visual attention to face processing to object categorization have developed during infancy Across this broad range of topics it is clear that much of our modern understanding of infant perceptual and cognitive development emerges from the foundation of classic information processing models of development such as that of Leslie B Cohen 1991 The recent advances illustrated in this book show how researchers have built on this foundation to uncover the mechanisms that drive

developmental change The Development of Perception, Cognition and Language Paul van Geert, 2017-03-31 Originally published in 1983 the aim of this book was to discuss some fundamental problems of cognitive developmental psychology at the time The theme which underlies the discussion is that scientific knowledge of the cognitive characteristics of other people starts from the cognitive instruments that we psychologist employ viz our theories models assumptions methods of enquiry etc Thus our scientific cognitive equipment not only provides the format in which cognition in other people is expressed it also exemplifies in some abstract sense this cognition The first part of the book deals with the concept of development in relation to the structure of developmental theories It is argued that theories originate from implicit conceptual analyses of implicit final state definitions Starting from this specific view on the nature of developmental theories the second part of the book discusses perception and perceptual development *Perceptual and Cognitive Development in Childhood* J. Developmental Psychology I J Gavin Bremner, Charlie Lewis, 2005-01-21 This is the first of two three volume collections on developmental psychology which provide a comprehensive and up to date synthesis of the most significant publications in the field of developmental psychology over the past century Over a total of six volumes the editors present the benchmark readings in the discipline including highly cited theoretical articles empirical articles as well as some book chapters that have

had great impact in terms of presenting research findings and influencing the key debates in the field. There is a particular emphasis on recent publications to complement older classic works illuminating new directions in the field theoretically and methodologically and on representing the discipline from an international perspective. In addition to the 88 key original publications included in the two collections, each of the volumes opens with an introductory editorial essay by the editors setting out the rationale behind the selection of papers in terms of their historical theoretical and empirical importance in the development of the field. The net effect is to provide an integrated account of this very established and expansive discipline.

Development of Perception in Infancy Martha E. Arterberry, Phillip J. Kellman, 2016-04-15 The developing infant can accomplish all important perceptual tasks that an adult can albeit with less skill or precision. Through infant perception research, infant responses to experiences enable researchers to reveal perceptual competence, test hypotheses about processes, and infer neural mechanisms, and researchers are able to address age-old questions about perception and the origins of knowledge. In *Development of Perception in Infancy: The Cradle of Knowledge Revisited*, Martha E. Arterberry and Philip J. Kellman study the methods and data of scientific research on infant perception, introducing and analyzing topics such as space, pattern, object, and motion perception through philosophical, theoretical, and historical contexts. Infant perception research is placed in a philosophical context by addressing the abilities with which humans appear to be born, those that appear to emerge due to experience, and the interaction of the two. The theoretical perspective is informed by the ecological tradition, and from such a perspective, the authors focus on the information available for perception when it is used by the developing infant, the fit between infant capabilities and environmental demands, and the role of perceptual learning. Since the original publication of this book in 1998, MIT, Arterberry and Kellman address in addition the mechanisms of change, placing the basic capacities of infants at different ages and exploring what it is that infants do with this information. Significantly, the authors feature the perceptual underpinnings of social and cognitive development and consider two examples of atypical development: congenital cataracts and Autism Spectrum Disorder. Professionals and students alike will find this book a critical resource to understanding perception, cognitive development, social development, infancy, and developmental cognitive neuroscience, as research on the origins of perception has changed forever our conceptions of how human mental life begins.

Developmental Psychology: Infant perceptual and cognitive development J. Gavin Bremner, Charlie Lewis, 2005 **Exploration of a Methodology for Measuring Perceptual and Cognitive Development in Infants** Irene Wong, 1970 **Early Category and Concept Development** David H. Rakison, Lisa M. Oakes, 2008-12-30 Whether or not infants' earliest perception of the world is a blooming, buzzing confusion, it is not long before they come to perceive structure and order among the objects and events around them. At the core of this process and cognitive development in general is the ability to categorize, to group events, objects, or properties together and to form mental representations or concepts that encapsulate the commonalities and structure of these categories. Categorization is the

primary means of coding experience underlying not only perceptual and reasoning processes but also inductive inference and language. The aim of this book is to bring together the most recent findings and theories about the origins and early development of categorization and conceptual abilities. Despite recent advances in our understanding of this area, a number of hotly debated issues remain at the center of the controversy over categorization. Researchers continue to ask questions such as: Which mechanisms for categorization are available at birth and which emerge later? What are the relative roles of perceptual similarity and nonobservable properties in early classification? What is the role of contextual variation in categorization by infants and children? Do different experimental procedures reveal the same kind of knowledge? Can computational models simulate infant and child categorization? How do computational models inform behavioral research? What is the impact of language on category development? How does language partition the world? This book is the first to address these and other key questions within a single volume. The authors present a diverse set of views representing cutting edge empirical and theoretical advances in the field. The result is a thorough review of empirical contributions to the literature and a wealth of fresh theoretical perspectives on early categorization.

Neoconstructivism Scott Johnson, 2010

Arguments over the developmental origins of human knowledge are ancient, founded in the writings of Plato, Aristotle, Descartes, Hume, and Kant. They have also persisted long enough to become a core area of inquiry in cognitive and developmental science. Empirical contributions to these debates, however, appeared only in the last century when Jean Piaget offered the first viable theory of knowledge acquisition that centered on the great themes discussed by Kant: object, space, time, and causality. The essence of Piaget's theory is constructivism: The building of concepts from simpler perceptual and cognitive precursors in particular from experience gained through manual behaviors and observation. The constructivist view was disputed by a generation of researchers dedicated to the idea of the competent infant endowed with knowledge of permanent objects that emerged prior to facile manual behaviors. Taking this possibility further, it has been proposed that many fundamental cognitive mechanisms—reasoning, event prediction, decision making, hypothesis testing, and deduction—operate independently of all experience and are in this sense innate. The competent infant view has an intuitive appeal attested to by its widespread popularity and it enjoys a kind of parsimony. It avoids the supposed philosophical pitfall posed by having to account for novel forms of knowledge in inductive learners. But this view leaves unaddressed a vital challenge to understand the mechanisms by which new knowledge arises. This challenge has now been met. The neoconstructivist approach is rooted in Piaget's constructivist emphasis on developmental mechanisms yet also reflects modern advances in our understanding of learning mechanisms, cortical development, and modeling. This book brings together for the first time theoretical views that embrace computational models and developmental neurobiology and emphasize the interplay of time, experience, and cortical architecture to explain emergent knowledge with an empirical line of research identifying a set of general purpose sensory, perceptual, and learning mechanisms that guide knowledge acquisition across different domains and

through development **Psychological Development From Infancy** Marc H. Bornstein, William Kessen, 2017-12-12
Originally published in 1979 this volume represented a unique attempt to connect the usually separated fields of infancy studies and studies of older children. In each chapter eminent research workers attempt to cross the theoretical, empirical, and methodological barriers that had traditionally separated the study of preverbal infants from the study of verbal children and adults at the time. These completely new and original contributions traced the developmental links between birth and conversation within three major categories: perceptual, cognitive, and language development. Although the chapters range from reports of well-defined research areas to theoretical propositions, the aim throughout was to relate the events of the first year of life to the child's later perceptual and cognitive activity. This book will still be of interest for all concerned with child development and related areas in that it demonstrates the remarkable range of observations about infants brought under a single guiding set of questions about continuity, stability, and the sources of change during and after the first year of life.

Building Object Categories in Developmental Time Lisa Gershkoff-Stowe, David H. Rakison, 2005-05-06 This book covers a broad range of current research topics in category development. Its aim is to understand the perceptual and cognitive mechanisms that underlie category formation and how they change in developmental time. The chapters in this book are
