

Pericyclic reactions

- A pericyclic reaction is one involving a concerted bond reorganization in which the essential bonding changes occur within a cyclic array of the participating atomic centers.
- An example is the reaction between butadiene and propenal which occurs on heating:

- The important feature is neither ions nor radicals are formed as intermediates.

Pericyclic Reactions G. Gill, 2012-12-06 1 1 orbital theory has had some notable successes in the analysis of individual organic reactions and in correlations between reaction series Gen II the theory has been invoked to explain known chemical phenomena and rather infrequently broadly based predictions In 1965 Woodward and published series of papers the 1 1 orbital interpretation of various types of concerted cyclo addition reactions which hitherto had rather been understood Because these processes now known as pericyclic reactions had great synthetic importance and because the Woodward Hoffmann theory was stated so explicitly as to allow useful and far reaching predictions to make the general acceptance of the so called Woodward Hoffmann Rules was very rapid Judging from the vast number of publications that have appeared great deal of experimental effort has channelled into this general area since that time the results of which provide vindication of the rules The theoretical basis of Woodward and Hoffmann's method has however the subject of criticism and controversy and of alternative theoretical methods have also appeared university departments including our own have for some time covered pericyclic reactions in their undergraduate and graduate courses Because aims teaching methods and personal preferences differ widely each of the various theoretical methods have achieved some currency We have sought to treat these methods in some sort of perspective The book is intended to be introductory being aimed primarily at final year undergraduates and first year postgraduates
