Pattillo, 2013-08-01 Peripheral arterial disease PAD is a cardiovascular disorder of the peripheral vasculature due to progressive atherosclerotic stenosis of conduit arteries restricting blood flow to tissues PAD is typically a disease of older

individuals and the incidence of PAD continues to rise due to an increase in cardiometabolic disease and an aging population. Importantly, all cause and cardiovascular morbidity and mortality are significantly increased in PAD patients. PAD diagnosis remains a significant challenge as a large number of patients are asymptomatic. Moreover, PAD results in a significant financial and societal burden with underutilized diagnostics and limited effective therapies. Here we discuss PAD signs and symptoms, pathophysiological mechanisms, current management, and future disease targets and possible therapeutic treatments for PAD.

Peripheral Arterial Disease Handbook William R. Hiatt, Judith Regensteiner, Alan T Hirsch, 2023-03-31. Approximately eight to twelve million individuals in the United States are affected by peripheral arterial disease (PAD). With 200 tables and illustrations and a single focus on peripheral arterial disease (PAD) rather than all vascular disorders, this Handbook is the ultimate clinical care primer for those who seek the most up to date and practical PAD clinical strategies. Comprehensive and easy to use, the book presents epidemiological and pathophysiological data in succinct format and includes a unique compendium of evidenced based and expert approaches for the diagnosis and treatment of peripheral arterial diseases. The diagnostic and treatment algorithms are derived from the experience of national experts and should provide guidance to both trainees and practicing clinicians.

Epidemiology of Peripheral Vascular Disease F.G.R. Fowkes, 2012-12-06. Major epidemiologists from the UK, USA and Europe contribute to the first ever much needed comprehensive review of the epidemiology of peripheral vascular disease in the lower limbs.

Peripheral Artery Disease (PAD) Neeraj N. Shah, 2016. This is a concise summary of information on the incidence, diagnosis, classification, and non surgical treatment of peripheral artery disease (PAD). PAD imposes a significant burden on the health care system. Patients suffering from PAD have leg pains, difficulty walking, and lower extremity ulcers. If untreated, this condition can result in limb loss. It is both a life and a limb threatening condition. It is important to recognise this condition early on, even in the absence of symptoms, in order to provide the best possible therapy in a timely manner. Early and aggressive treatment of PAD is crucial for limb salvage. The surgical therapeutic options for PAD are well known and described in the literature; however, the information on medical and other non surgical options for PAD is scattered and not well summarised. In this book, the authors have attempted to assimilate and summarise in one place all the available information regarding the epidemiology of PAD, clinical features of the disease, clinical and anatomical classification of PAD, medications used to treat PAD, role of fish oil supplementation in PAD, and the endovascular therapeutic options for PAD. The authors have summarised the latest available endovascular interventional strategies for the management of aortoiliac, femoropopliteal, as well as infrapopliteal PAD. Peripheral vascular intervention is an exciting and ever changing field, and the authors have attempted to synthesise information from all the major and relevant studies in this field. The authors hope that their book serves as a valuable reference resource for clinicians who are actively involved in the management of patients suffering from PAD, including primary care physicians, cardiologists, vascular surgeons, and cardiovascular fellows in training.
