Carlson,Charles Herbert Clemens,David R. Morrison,1991 In the late 1960s and early

1970s Phillip Griffiths and his collaborators undertook a study of period mappings and variation of Hodge structure. The motivating problems which centered on the understanding of algebraic varieties and the algebraic cycles on them came from algebraic geometry. However the techniques used were transcendental in nature drawing heavily on both Lie theory and hermitian differential geometry. Promising approaches were formulated to fundamental questions in the theory of algebraic curves, moduli theory and the deep interaction between Hodge theory and algebraic cycles. Rapid progress on many fronts was made in the 1970s and 1980s including the discovery of important connections to other fields including Nevanlinna theory, integrable systems, rational homotopy theory, harmonic mappings, intersection cohomology and superstring theory. This volume contains thirteen papers presented during the Symposium on Complex Geometry and Lie Theory held in Sundance, Utah, in May 1989. The symposium was designed to review twenty years of interaction between these two fields concentrating on their links with Hodge theory. The organizers felt that the time was right to examine once again the large issues of understanding the moduli and cycle theory of higher dimensional varieties which was the starting point of these developments. The breadth of this collection of papers indicates the continuing growth and vitality of this area of research. Several survey papers are included which should make the book a valuable resource for graduate students and other researchers who wish to learn about the field. With contributions from some of the field's top researchers, this volume testifies to the breadth and vitality of this area of research.

**In the Tradition of Thurston II** Ken'ichi Ohshika, Athanase Papadopoulos, 2022-08-02. The purpose of this volume and of the other volumes in the same series is to provide a collection of surveys that allows the reader to learn the important aspects of William Thurston's heritage. Thurston's ideas have altered the course of twentieth century mathematics and they continue to have a significant influence on succeeding generations of mathematicians. The topics covered in the present volume include complex hyperbolic Kleinian groups, Mbius structures, hyperbolic ends, cone 3-manifolds, Thurston's norm, surgeries in representation varieties, triangulations, spaces of polygonal decompositions and of singular flat structures, on surfaces, combination theorems in the theories of Kleinian groups, hyperbolic groups and holomorphic dynamics, the dynamics and iteration of rational maps, automatic groups and the combinatorics of right angled Artin groups.

These texts contain 29 articles by contributors to the conference and other distinguished mathematicians working in related areas including three Fields Medallists. The articles cover a broad range of topics in differential, algebraic and symplectic geometry and also in mathematical physics. These volumes will be of

interest to researchers and graduate students in geometry and mathematical physics

### **Featured Reviews in**

**"Mathematical Reviews" 1995-1996** Donald G. Babbitt, Jane E. Kister, This collection of reprinted Featured Reviews published in Mathematical Reviews MR in 1995 and 1996 makes widely available informed reviews of some of the best mathematics published recently. Featured Reviews were introduced in MR at the beginning of 1995 in part to provide some guidance to the current research level literature. With the exponential growth of publications in mathematical research in the first half century of MR it had become essentially impossible for users of MR to identify the most important new research level books and papers especially in fields outside of the users own expertise. This work identifies some of the best new publications, papers and books that are expected to have a significant impact on the area of pure or applied mathematics with which researchers are concerned. All of the papers reviewed here contain interesting new ideas or applications, a deep synthesis of existing ideas or any combination of these. The volume is intended to lead the user to important new research across all fields covered by MR.

**Representation Theories and Algebraic Geometry** A. Broer, 2013-03-09 The 12 lectures presented in Representation Theories and Algebraic Geometry focus on the very rich and powerful interplay between algebraic geometry and the representation theories of various modern mathematical structures such as reductive groups, quantum groups, Hecke algebras, restricted Lie algebras and their companions. This interplay has been extensively exploited during recent years resulting in great progress in these representation theories. Conversely a great stimulus has been given to the development of such geometric theories as D-modules, perverse sheaves and equivariant intersection cohomology. The range of topics covered is wide from equivariant Chow groups, decomposition classes and Schubert varieties, multiplicity free actions, convolution algebras, standard monomial theory and canonical bases to annihilators of quantum Verma modules, modular representation theory of Lie algebras and combinatorics of representation categories of Harish-Chandra modules.

**Automorphic Forms and Galois Representations** Fred Diamond, Payman L. Kassaei, Minhyong Kim, 2014-10-16 Part one of a two volume collection exploring recent developments in number theory related to automorphic forms and Galois representations.

**Automorphic Forms and Galois Representations: Volume 1** Fred Diamond, Payman L. Kassaei, Minhyong Kim, 2014-10-16 Automorphic forms and Galois representations have played a central role in the development of modern number theory with the former coming to prominence via the celebrated Langlands program and Wiles proof of Fermat's Last Theorem. This two volume collection arose from the 94th LMS EPSRC Durham Symposium on Automorphic Forms and Galois Representations in July 2011 the aim of which was to explore recent developments in this area. The expository articles and research papers across the two volumes reflect recent interest in  $p$ -adic methods in number theory and representation theory as well as recent progress on topics from anabelian geometry to  $p$ -adic Hodge theory and the Langlands program. The topics covered in volume one include the Shafarevich Conjecture, effective local Langlands correspondence,  $p$ -adic  $L$ -functions, the fundamental lemma and other topics of contemporary interest.

*Real Non-Abelian*

*Mixed Hodge Structures for Quasi-Projective Varieties: Formality and Splitting* J. P. Pridham, 2016-09-06 The author defines and constructs mixed Hodge structures on real schematic homotopy types of complex quasi projective varieties giving mixed Hodge structures on their homotopy groups and pro algebraic fundamental groups The author also shows that these split on tensoring with the ring  $\mathbb{R}[x]$  equipped with the Hodge filtration given by powers of  $x$  giving new results even for simply connected varieties The mixed Hodge structures can thus be recovered from the Gysin spectral sequence of cohomology groups of local systems together with the monodromy action at the Archimedean place As the basepoint varies these structures all become real variations of mixed Hodge structure

### **Hodge Theory, Complex Geometry, and**

**Representation Theory** Mark Green, Phillip Griffiths, Matt Kerr, 2013-11-05 This monograph presents topics in Hodge theory and representation theory two of the most active and important areas in contemporary mathematics The underlying theme is the use of complex geometry to understand the two subjects and their relationships to one another an approach that is complementary to what is in the literature Finite dimensional representation theory and complex geometry enter via the concept of Hodge representations and Hodge domains Infinite dimensional representation theory specifically the discrete series and their limits enters through the realization of these representations through complex geometry as pioneered by Schmid and in the subsequent description of automorphic cohomology For the latter topic of particular importance is the recent work of Carayol that potentially introduces a new perspective in arithmetic automorphic representation theory The present work gives a treatment of Carayol's work and some extensions of it set in a general complex geometric framework Additional subjects include a description of the relationship between limiting mixed Hodge structures and the boundary orbit structure of Hodge domains a general treatment of the correspondence spaces that are used to construct Penrose transforms and selected other topics from the recent literature A co publication of the AMS and CBMS
