## 26.1 Electromagnetic Waves

*2014 ScienceDirect Research Program Document CAA325-15 4-00003*

*As An Editor, Ananthanarayan Sengupta, Jeff Kang*

Electromagnetic waves are studied with applications to geophysical subsurface probing,<sup>[1,2]</sup> Smith–Purcell radiation from metallic gratings,<sup>3</sup> scattering from inhomogeneous plates,<sup>4</sup> and with the intensity of snowmeter focus wave mode.<sup>5</sup> The electromagnetic field due to dipole antennas in a two-layer medium is modeled, in such as the case, is solved using the quasi-static approximation,<sup>6</sup> no variations in integral forms are calculated with finite time numerical integration methods, the multi-image approach with the sweeping method method, the modal approach by finding the residues, and a hybrid approach combining the latter two methods.<sup>7</sup> The Smith–Purcell radiation problem which takes into account the phenomena properties of metallic gratings is solved.<sup>8</sup> An electron beam moving across the surface of a metallic grating will cause emission of electromagnetic radiation. It is shown that maximum radiation occurs when the surface plasmon mode is excited. The scattering problem involving inhomogeneous plates is solved with the help of the method of moments.<sup>9</sup> By defining independent basis functions on overlapping conductors and then joining them at the common edges, we can model complex structures efficiently while satisfying Kirchhoff's current law on the surface of the conductors. The focus wave modes refer to electromagnetic waves that run on a localized two-dimensional plane and propagate at the speed of light without dispersing. We have shown that such waves must have infinite electromagnetic energy in the source-free, three-dimensional space.<sup>10</sup> A general formula on dual partitions is considered set of basis wave modes with Helmholtz-Green's function method is developed.
