Gersh, 2008-04-15 This second edition is a ground breaking clinical text with a strong emphasis on rigorous evidence Leaders in the field discuss best practice in the light of systematic reviews and randomised control trials and how best to treat where the information is less clear Case histories provide intriguing discussions on how to apply the evidence in real life situations Evidence based Cardiology also includes free access to the latest evidence which is automatically posted on a companion website

Economic Aspects of Preventive Measures in Coronary Artery Disease Ortrud Wendt, 1997-09-15 Inhaltsangabe Abstract An ounce of prevention is worth a pound of cure Rarely are there any objections to this old proverb Its significance is underscored by the fact that the Major causes of death today are the degenerative chronic diseases of civilization Abundant evidence has been accumulated that these diseases can often be prevented However the appeal of prevention lies not only in its ability to reduce suffering from disease but also in its assumed power to reduce the costs of health care At first sight it appears that promoting health and preventing disease would easily rehabilitate the health care system granting prevention a prominent spot on the health policy agenda For example in Germany prevention in the form of health check ups was introduced to the catalogue of services to be offered by health insurance companies in 1989 Yet concerns have been raised that prevention may not reduce but rather add to the costs of health care Especially in the case of prevention of chronic diseases death or sickness can only be postponed but never avoided Thus a careful analysis of all the effects of preventive measures is necessary to assess their full economic consequences Cardiovascular diseases primarily coronary artery disease and stroke account for the majority of deaths in industrialized countries In the United States these diseases kill nearly as many Americans as all other diseases combined and are also among the leading causes of disability The aggregate cost of coronary artery disease CAD in the United States is enormous costing the country between 50 and 100 billion dollars per year for medical treatment and lost wages Nonetheless over the past two decades the mortality from cardiovascular disease has declined dramatically 40 per cent for coronary artery disease Major contributions to this decline came from risk factor reduction and changes in lifestyles Moreover new technology improved pharmacology as well as better surgical techniques contributed to this decline Risk factor reduction and changes in lifestyle are preventive measures in

coronary artery disease with a straightforward appeal Preventing the disease not only means avoiding the pain and suffering of the individual but also avoiding the risk of irreversible consequences and permanent damage In addition to these obvious benefits the costs of many preventive measures for example screening tests appear to be very small Nevertheless the
