Nutritional Treatment of Chronic Renal Failure Sergio Giovannetti, 2012-12-06 Enormous progress has been made in the treatment of chronic renal failure over the last decades Until the 1950s chronic renal failure was considered to be an inexorably lethal condition This is no longer the case In addition the disease severe uremic syndrome is now extremely rare if existent at all in industrialized countries Physicians of my generation who saw patients hospitalized with hemorrhages pericarditis severe anemia cardiac failure malignant hypertension pruritus vomiting generalized edema and convulsions are particularly grateful for this progress I well remember seeing such patients hospitalized in the last days or weeks of their lives and also remember the sense of impotence I suffered for the complete lack of efficient measures I had at my disposal to manage their condition Nowadays hemodialysis peritoneal dialysis and kidney transplantation allow patients with chronic renal failure to survive for very long periods of time in a satisfactory condition Why then is there still a sense of dissatisfaction and why should we study dietary management The drawbacks of dialysis and transplantation are the main reasons but the certainty that dietary therapy is complementary to dialysis and even better than dialysis in certain conditions is also very important
