Danford, H.N. Munro, 2013-11-11 The proportion of the population over 65 years of age is increasing steadily in most industrialized countries In the United States the proportion of elderly people has risen from four percent in 1900 to 11 % in 1978 and is projected to be 14% by the year 2000 The occurrence of debilitating chronic diseases in the elderly increases with each additional year These diseases along with the natural loss of tissue function that occurs throughout adult life impose a heavy burden on the health care system

Nutrition plays an important etiologic role in many of these degenerative changes. Consequently the aging segment of the population presents a challenge to the nutrition scientist who should be able to recommend optimal intakes of nutrients to minimize the functional losses associated with aging and to optimize the health of those already elderly. This sixth volume in the series *Human Nutrition: A Comprehensive Treatise* provides a conspectus of the various interactions of nutrition with the aging process and a comprehensive survey of current knowledge of the amounts of individual nutrients needed by the elderly. The volume begins with a general survey of the multifaceted relationship of nutrition to aging followed by four chapters on how nutrition can affect age-related changes in selected body functions. The next six chapters cover the available evidence regarding the needs of the elderly for dietary energy, protein, calcium, trace elements, vitamins, and fiber. *Nutrition in the Prevention and Treatment of Disease*. Ann M. Coulston, Carol J. Boushey, Mario Ferruzzi, 2013. This comprehensive clinical nutrition textbook uniquely focuses on the clinical applications and disease prevention of nutrition, clearly linking the contributions of basic science to applied nutrition research and in turn to research-based patient care guidelines.

Monitoring Dietary Intakes Ian Macdonald, 2012-12-06. The International Life Sciences Institute (ILSI), a nonprofit public foundation, was established in 1978 to advance the sciences of nutrition, toxicology, and food safety. ILSI promotes the resolution of health and safety issues in these areas by sponsoring research, conferences, publications, and educational programs. Through ILSI's programs, scientists from government, academia, and industry unite their efforts to resolve issues of critical importance to the public. As part of its commitment to understanding and resolving health and safety issues, ILSI is pleased to sponsor this series of monographs that consolidates new scientific knowledge, defines research needs, and provides a background for the effective application of scientific advances in toxicology and food safety. Alex Malaspina, President, International Life Sciences Institute. Preface: We live in a changing world. The everyday ongoing changes in people's habits and the availability of foods in the market lead to continuous changes in food consumption patterns. Changes we need to understand since they play an important role in nutrition as well as toxicology. In nutrition, food intake data provide us with the information needed to examine whether, on the one hand, these modifications are still within the limits of nutritional safety and, on the other, whether they offer the possibility of monitoring the evolution of dietary habits. In toxicology, food intake data are used to calculate the potential intake of substances used as additives or substances that enter food as contaminants such as pesticide residues, packaging materials, and radionuclides. Vital and Health Statistics, 1965.
