Abstract

Objective: The study aimed to investigate the role of nutrition-sensitive and specific interventions along with nutrition education on child stunting during the first 1000 days in Ethiopia.

Methods: An adequacy evaluation study was used to see changes between the baseline and end-line data after following for 1 year. A sample of 170 mother-child pairs who had a 1-year follow-up was used to detect differences. We performed structural equation modeling to elucidate changes in feeding behaviors, socioeconomic status, water, sanitation and hygiene on child linear growth. Furthermore, the independent effect of covariates on child linear growth was handled using a general linear model.

Results: A total of 170 and 270 mother-child dyads were interviewed at baseline and end-line surveys, respectively. After about 1 year of intervention, the annual rate of stunting prevalence declined from 29.3% (95% confidence interval [CI] = 18.6, 42.7) to 16.4% (95% CI = 10.7, 24.2). There was a significant change in the mean of length-for-age Z-score which changed from -1.18 to -0.45 ($P < .034$). Adjusting for the different constructs of the health belief model, child sex, age, feeding behaviors, and dietary diversity, one egg consumption per day was responsible for the most significant variability explained (36%) for stunting reduction.

Conclusions: Sustainable access to egg consumption for children below 2 years experienced a substantial reduction in childhood stunting. A combination of nutrition-sensitive agricultural and direct nutrition interventions along with behavioral-based education is a sustainable strategy in reducing and preventing child growth from faltering in the early life stages.

Abstract In 1981 the USDA proposed changes in meal pattern requirements in effect since 1946 for the school lunch program
The regulations proposed a decrease in the amount of protein rich foods to one and one half ounces fruits or vegetables to
one half cup bread to 1 serving and milk to 6 ounces for elementary children The wisdom of the proposal was questioned by
subcommittee Chairman Perkins who believes it will deprive children of nutrients needed for growth health and well being

Friedman,2013-03-09 The nutritional quality of a protein depends on the proportion of its amino acids especially the essential
amino acids their physio logical availability and the specific requirements of the consumer Availability varies and depends on
protein source interaction with other dietary components and the consumer s age and physiological state In many foods
especially those from plants low levels of various essential amino acids limits their nutritive value This is particularly
important for cereals which may be inadequate in the essential amino acids isoleucine lysine threonine and tryto phan and
legumes which are often poor sources of methionine Moreover these commodities are principle sources of protein for much
of the earth s rapidly growing population At the current annual growth rate of about 2 percent the world population of about
4 billion will increase to 6 5 billion by the year 2000 and to 17 billion by the year 2050 Five hundred milliQn people are
presently estimated to suffer protein malnutrition with about fifteen thousand daily deaths The ratio of malnourished to
adequately nourished will almost surely increase For these reasons and especially in view of the limited availability of high
